1. Welcome to COPA-DATA help

GENERAL HELP

If you cannot find any information you require in this help chapter or can think of anything that you would like added, please send an email to documentation@copadata.com (mailto:documentation@copadata.com).

PROJECT SUPPORT

You can receive support for any real project you may have from our Support Team, who you can contact via email at support@copadata.com (mailto:support@copadata.com).

LICENSES AND MODULES

If you find that you need other modules or licenses, our staff will be happy to help you. Email sales@copadata.com (mailto:sales@copadata.com).

2. Project conversion

When using new version of zenon projects which were created with earlier versions must be converted to the new version. If certain properties or changes bust be considered at converting, they are described in the hints for converting in this manual.
License information

Part of the standard license of the Editor and Runtime.

CONVERTING AT UPDATE AND DOWNGRADE

If you want to update zenon to a higher version, projects are converted automatically to the higher version when opened in the new version. From this time you cannot edit the project with earlier versions of the Editor. However a project backup is created automatically of the converted project in the original version.

Converting a project to an earlier version which was created with a older version (downgrade) is not possible.

BACKWARD COMPATIBILITY

As of version 6.21 projects are downward compatible for the Runtime. You can work in an Editor with a higher version number. This Runtime backwards compatibility is particularly suited for use of mixed versions such as: A project which was engineered with version 6.50 can be used in a Runtime with version 6.22.

Attention

If, in a project with a later version of the Editor, properties are shown that are not available in the earlier version, it can lead to undesired results in the Runtime.

3. Recommended procedure for converting Runtime files

At the project conversion take care that the Runtime changeable files are also converted correctly.

To convert the Runtime changeable files:

1. Import the files from the Runtime to the original version of the Editor.
2. Carry out the update to the new version.
3. Navigate to the General section in project properties.
4. Click on the RT changeable data property.

5. The dialog for the settings of the Runtime changeable files is opened.

6. Deactivate all check boxes in column Do not generate and transfer

7. Compile the project (Create all Runtime files)

8. Change the check box in the RT changeable data property back to the status before the conversion

4. Converting from version 2.20 to 3.04

4.1 Restructuring the database

1. Create a temporary directory and a subdirectory. Name of the subdirectory: XX. For example: C:\TEMP\XX where C:\TEMP is the path of the original database and C:\TEMP\XX is the path for the restructured database. Do not forget to make a backup of your original database.

2. Copy the original database and REV.BAT and DATAMGR.RDL to C:\TEMP.

3. Copy the new DBD files (of the new database) and the file DBAREORG.EXE to the XX directory.

4. Set the paths to the folder, where DBREV.EXE and INITDB.EXE are, or copy these files to C:\TEMP and also to C:\TEMP\XX. Check if these two programs can be started in the DOS window without entering their path.
5. Make sure, that enough space (min. 500 K) is available in the DOS memory area.

6. Execute the batch file `REV.BAT` in the DOS window:

<table>
<thead>
<tr>
<th>Content</th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td><code>del *.taf</code></td>
<td></td>
</tr>
<tr>
<td><code>del *.log</code></td>
<td></td>
</tr>
<tr>
<td><code>cd xx</code></td>
<td></td>
</tr>
<tr>
<td><code>del *.taf</code></td>
<td></td>
</tr>
<tr>
<td><code>del *.log</code></td>
<td></td>
</tr>
<tr>
<td><code>initdb datamgr</code></td>
<td></td>
</tr>
<tr>
<td><code>cd ..</code></td>
<td></td>
</tr>
<tr>
<td><code>dbrev -r -v -q -s datamgr.rdl datamgr xx/datamgr</code></td>
<td></td>
</tr>
</tbody>
</table>

7. Start `DBAREORG.EXE` in the directory zenon directly from Windows (execute file).

8. Define the directory where the database is (XX) with CONVERT 2xx -> 3xx and PATH SETTINGS.

9. Start restructuring with CONVERT 2xx -> 3xx and CONVERT.

10. Restructuring is finished. The new database is in the XX path. If existing please delete the TAF files from the XX directory. The original database still is in the TEMP directory.

11. If restructuring is not successful on the first attempt, you have to restart with step 1. Otherwise the restructured database would be converted another time.

<table>
<thead>
<tr>
<th>Result of restructuring</th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>all screens are converted</td>
<td></td>
</tr>
<tr>
<td>all variables are converted</td>
<td></td>
</tr>
<tr>
<td>all functions are converted, but the functions have to be relinked. Exception: the “Switch to screen” function no longer needs to be relinked.</td>
<td></td>
</tr>
<tr>
<td>a log file (<code>DBAREORG.LOG</code>) is created in the folder from which <code>DBAREORG.EXE</code> has been started. There you can find information on the unlinked functions.</td>
<td></td>
</tr>
</tbody>
</table>
4.1.1 Restructuring the database when the structures changed

1. Create a temporary subdirectory. Name of the subdirectory: XX

2. Copy the new DBD files to the XX directory.

3. Execute the batch file REV.BAT:

<table>
<thead>
<tr>
<th>Contents</th>
<th>Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>del *.taf</td>
<td></td>
</tr>
<tr>
<td>del *.log</td>
<td></td>
</tr>
<tr>
<td>cd xx</td>
<td></td>
</tr>
<tr>
<td>del *.taf</td>
<td></td>
</tr>
<tr>
<td>del *.log</td>
<td></td>
</tr>
<tr>
<td>initdb datamgr</td>
<td></td>
</tr>
<tr>
<td>cd..</td>
<td></td>
</tr>
<tr>
<td>dbrev -r -v -q datamgr xx/datamgr</td>
<td></td>
</tr>
</tbody>
</table>

5. Converting from version 3.4, 3.50 to 3.52

5.1 Operating system

Version 3.52 only runs under Windows NT 4.0 and WIN 95.
5.2 AML/CEL-Export

The export name of alarm and CEL entries has changed. Now Ayymmdd.TXT or Cyymmdd.TXT. For the export there is a new function, which can be executed e.g. with time control. The old settings are omitted.

5.3 AML / CEL, Archives

Now archives for alarm list and CEL are stored as a default. These day archives have no file limitations. For this reason you should engineer a delete function. With this you make sure that not the whole storage capacity of the hard-disk is filled with archives (see function file operations). The available memory for reading archives is limited with the following entry in the zenon6.ini.

[ARCHIV]

...  
SPEICHER=1000  (default=1000, that is 1MB)

5.4 Network operation

The drivers have to be set to local. In the section [Befehlsgabe] of the zenon6.ini the entry Treiber= has to be deleted.

5.5 Archives

Archives now are stored in a subdirectory of the project path. On the first start existing ARV files are moved there.

5.6 Layer

In DXF import layers are no longer supported. Layers now are called symbols.
5.7 Arcs

Arcs have been replaced by segments of circles. Existing arcs retained until changes are made.

5.8 Backward compatibility

Version 3.52 is not downwards compatible. (Concerns e.g. zenon.ini, symbols and functions administration)

5.9 Database

A new database structure file is delivered. (DATAMGR.DBD, 20.11.1996, 14.759 byte)

This file is needed for lot archives and has to be copied to the project directory.

Delete *.TAF and *.LOG files in the project directory.

5.10 Backup documentation (QRF inquiries)

In the QRF files the inquiries for VARIABLE and LANGTEXT have been changed.

- field VARIABLE = dwkanalNr translate using 1 display as left (30);
- field LANGTEXT = dwkanalNr translate using 6 display as left (39);

5.11 American time formats

As a time format AM/PM is not supported.

5.12 Alarm printer

If the alarm printer fails, the control system now automatically switches to the Windows standard printer. If no print out should happen, the alarm printer in the Editor has to be deleted.
5.13 Symbols

After rescaling symbols have to be resolved and relinked before storing them in the symbol library. Bitmaps in symbols have to be stored separately. Symbol files are saved in folder ../zenon.

5.14 Zoom function

The zoom function may be used to check or edit elements.

5.15 Project backup

A database now consists of the following files:

<table>
<thead>
<tr>
<th>File Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>*.vbf</td>
<td></td>
</tr>
<tr>
<td>*.idx</td>
<td></td>
</tr>
<tr>
<td>*.DAT</td>
<td></td>
</tr>
<tr>
<td>*.BIN</td>
<td></td>
</tr>
<tr>
<td>*.dbd</td>
<td></td>
</tr>
<tr>
<td>*.INI</td>
<td></td>
</tr>
<tr>
<td>*.mdb</td>
<td></td>
</tr>
<tr>
<td>*.MIB (for NWM III)</td>
<td></td>
</tr>
<tr>
<td>*.NWM (for NWM III)</td>
<td></td>
</tr>
<tr>
<td>*.EMS (for 230 EMS)</td>
<td></td>
</tr>
</tbody>
</table>

For saving the archives (*.ARV, *.CEL, *.AML) the according subdirectory has to be regarded.
**Attention**

The file `ALARM.BIN` in the archive directory saves the last contents of the alarm list when closing the Runtime and should not be saved.

---

### 5.16 Filter for system windows

We recommend checking the filters for the system screens with the new functionalities (e.g. scheduler, archives for AML/CEL).

### 5.17 Export variable

For using the export file under dBase, Foxpro the max. column width for variable name and identification (long text) has to be limited from 128 characters to max. 100 characters.

Therefore the following `zenon6.ini` entry is necessary:

```
[EXPORT]
MAX_LAENGE= z. B. 40
```

### 5.18 Element Link text

In old projects texts are no longer centered but left aligned. This can be changed in the element parameters. If this leads to extensive changes in existing projects, please proceed in the following way:

1. Enter `Konvert=1` in the `zenon6.ini`
2. Set the option old text elements in the Editor under Open screen; then open the according screen and save it. Repeat this procedure for each screen concerned.
3. Delete `Konvert=1` in the `zenon6.ini`
6. Converting from version 3.52 to 5.11

6.1 Things to be done in version 3.52

6.1.1 Preparatory works

We recommend to create a backup of the project in the old version.

The project database should be checked with the provided tool DBCHECK in version 3.52. If any errors occur during the check, they can be fixed with the also provided tool DBFIX in version 3.52.

6.1.2 Rotated texts

Rotated texts behave differently in version 3.52 and version 5.50 – as far as positioning is concerned – and have to be edited.

In order to get a display compatible to version 3.52, the following entry in the project.ini has to be set:

```
[VERSION]
TEXT352=1
```

6.1.3 Screen names with special characters

Screen names must not contain special characters such as / : * ? < > | Ä Ö Ü because the screens are saved as files. The Windows operating system does not allow such special characters.
If existing screen names contain such special characters, these screen names have to be changed in the old version e.g. 3.52, before the screens can be converted to version 5.x.

⚠️ **Attention**

*Additionally all functions containing invalid screen names have to be changed.*

If these changes are not done, the according screens are not converted and are not available in version 5.x.

⚠️ **Attention**

If in a 3.5x project there are missing frames or empty allocations, the following error message opens on starting the Runtime 5.11: It was tried to access a file behind the end of the file and the Runtime crashed.

*So before conversion old 3.5x projects have to be checked on missing frames or empty allocations.*

### 6.2 Things to be done in version 5.11

zenon version 5.11 must be installed.

#### 6.2.1 Licensing

The license numbers of version 5.x are not compatible with the license numbers of previous versions. For updates new license numbers have to be ordered and entered in the Editor. Licenses for all versions up to 3.52 stay untouched, as the new serial numbers are stored in new entries in the `zenon.ini`.

```
[DEFAULT]
SERIAL5=xxx
```
ACTIVATIONKEY5=xxx

No login name can be stored in the start buttons any more.

An existing Project has to be inserted into a new workspace.

The simulation driver now works with the same driver model as all other drivers. Under Driver/Configuration Hardware has to be selected.

After loading the 3.52 project and converting the screens the correct monitor profile has to be selected and the Editor has to be restarted.

In the zenon.ini there is an entry defining the size of the driver buffer. As a rule of thumb we recommend Number of variables * 10.

[RT]

DRIVER_QUE =50000

If the value is too small, this can result in update problems in the visualization.

We recommend to alarm an overflow. There is a system driver variable for this: Project info/Driver queue.

7. Converting from version 3.52 to 5.x or 6.x

7.1 Convert dynamic element switch

Switches which were created in a project of version 3.52 must be converted via XML export when switching to a higher zenon version.

Procedure in the new zenon version:

1. Context menu screens -> XML export all
2. Export screens in new file
3. *Context menu screens* -> *Import XML*

4. select exported file and import it

8. **Converting from version 5.11 to 5.50**

8.1 Things to be done in version 5.11

We recommend to create a backup of the project before converting it. The Editor data and the Runtime changeable data have to be saved.

The project database should be checked and repaired if necessary. You will find more information on this on the installation CD under `Software\TOOLS\DB_TOOLS\DB_DOKU.DOC`.

8.2 Things to be done in version 5.50

zenon version 5.50 must be installed.

After starting the Editor the old workspace can be opened. The projects then are converted automatically.

After creating the Runtime files the Runtime can be started.

9. **Converting from version 5.50 to 6.01**

⚠️ **Attention**

*Not translated keywords in the language table are deleted during the conversion process.*
9.1 Things to be done in version 5.50

Before the converting can be carried out, the data must be read back to the engineering computer. After that the converting may be started.

In the properties window of the project under 'General' you can find the dialog 'RT changeable data'. Here you determine which data should be changed. For more information refer to chapter RT changeable data.

9.1.1 Function names

You have to care, that the functions names are unique. As no function names have to be defined in version 5.50, zenon does not check the uniqueness. This is not necessary for version 5.50. In version 6.x however the functions are identified by their names.

9.1.2 Projects

Before a 5.50 project can be opened in the Editor version 6, it has to be converted. (File - Insert project 5.50...). The old project stays unaffected and a copy of it is created in the SQL server. Please be aware, that some external files and directories are not automatically added to the new Editor and Runtime directory structure. These files/directories have to be adapted or inserted into the project manually (in the project tree / Files)

This is true for e.g.: user-defined subdirectories in the project directory, extended list directories, databases, export folders, etc....

9.1.3 Runtime changeable project data (users, recipes, etc.)

Have to be read back to the Editor before the conversion, so that no changes done in the Runtime get lost.

9.1.4 Data

The files created by the Runtime such as AML files, CEL files, HD data, bin files etc. are compatible. These have to be copied to the corresponding Runtime directories of version 6 by hand. Please be aware, that
these files are converted on the first start of the Runtime. This may take some time for large amounts of data.

### 9.1.5 Profiles

In version 5.50 the profiles for alarming, Extended Trend, etc. are saved in the file with the name of the project and the extension zrt. Example: For the project Project1 this file is named Project1.zrt. This file has to be renamed to `project.zrt` after having converted the project. Then the file has to be moved to the same folder in the RT path, where also the project.ini is saved.

### 9.1.6 3S Arti driver (since SP2)

The name of the variable allocation file for the 3S Arti driver has changed. So the file has to be renamed, before new variables can be browsed from the PLC. You will find more information in the driver documentation.

### 9.2 Things to be done in version 6.01

zenon version 6.01 must be installed.

#### 9.2.1 Licensing

The license numbers of version 6.x are not compatible with the license numbers of previous versions. For updates new license numbers have to be ordered and entered in the Editor. Licenses for all versions up to 5.x stay untouched, as the new serial numbers are stored in new entries in the `zenon6.ini` instead of the `zenon.ini`.

#### 9.2.2 User administration / password system

In the user administration of version 6.x there is the new property Administrator. Now only administrators are allowed to edit user data in the Runtime. As this property did not exist in older versions, as a default it is inactive for the existing users. If users still should be able to edit user data in the Runtime, this has to be defined accordingly in version 6.x.
9.2.3 Configuration settings

Additionally all properties of the projects as well as all settings under Options/Settings have to be checked.

As the zenon.ini has been replaced by the zenon6.ini, probable manual changes (e.g. the entry SPEICHER= for archiving) have to be copied from the zenon.ini to the zenon6.ini manually.

9.2.4 the Simulator driver

As also the current settings for the simulation driver are stored in the zenon.ini, they now are taken from the zenon6.ini. After the new installation there are the default settings. So after the installation they have to be edited according to the old zenon.ini.

After creating the Runtime files the Runtime can be started.

9.2.5 Screen functions

In version 5.50 and lower, only scripts (but not functions) could be linked to screens. These scripts which were executed automatically when a screen was closed or opened.

In version 6.01 and above, only functions can be linked screens, so all links to scripts are lost. The screens have to be relinked with the desired functions.

10. Converting from version 5.50 to S7 dBase export

When converting a 5.50 project, a converting error may occur. Typical error message:
"Error driver 'SIMUL32 - SIMULATORDRIVER' variable 'Sub_Visu_E1_IGEF' type for primitive object '34' data type 8 not defined."

REASON:
The variables were
Conversion from version 6.01 to 6.20

Projects of the version 6.01 have to be converted when loaded in the current Editor for the first time. A backup of the project is automatically created in the directory \SQL\Backup.

**Attention**

*Not translated keywords in the language table are deleted during the conversion process.*

11.1 Evacuating archives to SQL database

The database table `<Project name>_<shortcut>` gained two columns.

- **GUID**: char 36. Contains the project GUID of the variable from another project or is ZERO if in the own project.

- **STRVALUE**: varchar. Contains the archived string values. For numerical variables this field has the value ZERO.

  The length of the varchar datafield depends on the longest string variable to be archived. The length of the string variable is defined in the variable properties.

The database table `<project name>_VARIABLES` has one more column.
Conversion of multi-user projects from version 6.20 to 6.20 SP1

- GUID: char 36. Contains the project GUID of the variable from another project or is ZERO if in the own project.

These new columns either have to be added to the SQL database by hand, or they are added from the Editor. In the Editor you have to switch to the the property page save in all concerned archives. There you open the connection string to the database and confirm the dialog. On closing the dialog the changes in the database are done.

⚠️ **Attention**

*If these changes are not done, no archive data will be evacuated to the SQL database.*

12. Conversion of multi-user projects from version 6.20 to 6.20 SP1

Multi-user projects can only be converted if no elements are checked out. This means that all engineers have to check in their changes first.

If this is not possible for any reason, first a project backup of the project on the project SQL Server has to be done and to be restored immediately. This resets all the *Under construction* information.

⚠️ **Attention**

*All changes in the local project versions are lost.*

The conversion can only be done on the PC, on which the central project database resides. If no Editor (standalone database server) is installed on this PC, the 6.20 SP1 Editor first has to be installed there. Only after that can the conversion be done on this PC.

**INSTRUCTIONS ON THE UPDATE TO THE NEW VERSION WITH A NEW DATABASE**

With this procedure, we assume that the old database is no longer used. In doing so:

- Files that can be amended in Runtime are taken into account
Multi-user clients are removed before the project is backed up

**TASKS IN VERSION 6.20**

The following steps are carried out on all client computers for multi-user projects:

1. On all clients, for all objects with the status **Check out**, either **Check in** or **Undo check out**. No object can have the status **Check out**.
2. Delete the respective local projects in the Editor.

The following steps are carried out on the computer with the database for multi-user projects:

1. Optional: Import all changes that have been made in Runtime:
   a) For all modules: Set the status **Allow changes**
   b) Navigate to the project properties General -> RT changeable data and set all check boxes for **Do not decompile to inactive**.
   c) Read all files from Runtime back into the Editor via Remote Transport.
   d) Set the check boxes in RT changeable data back to the desired status.
   e) For all modules: Set the status **Accept changes**.
   f) Repeat these steps for all projects.
2. in the context menu of the workspace, select the **Add existing project** command.
3. Navigate to the project, expand the subnode **Connected local project copies**.
4. Carry out the following step for all listed computers, with the exception of the computer with the role of database server:
   - Right click on the connected computer and select **Disconnect connection**.
5. Repeat steps 2 and 4 for all projects.
6. Create a backup of the workspace and a project backup for each project.

**TASKS IN VERSION 6.20 SP1**

The following steps are carried out on the computer with the database for multi-user projects:

1. Install the new Editor
2. Restart the computer
   Note: From this moment, the old database is no longer used.

3. Read back the workspace backup:
   a) Select the same folder as that in which the workspace of the version was located.
   b) Select yes to overwrite the existing workspace.
   c) Select yes to convert all projects.

4. Ensure that port 1433 is not blocked by a firewall or add the SQL Browser to the exceptions for the firewall rules.

5. Ensure that the new SQL server allows remote connections.
   To do this, connect to SQL Server Management Studio and check the properties in the Connections section.

The following steps are carried out on all client computers for multi-user projects:

1. Install the new Editor

2. Restart the computer

3. Open the existing workspace.
   In the process, error messages are displayed in the output window.

4. In the context menu of the workspace, select the Add existing project command

5. Enter the name of the computer with the database for multi-user projects.

7. Select the project that is to be added.
   a) Start with the global project.
   b) Then add, if applicable, the integration project.
   c) Then add all other desired projects.

The projects should now be in the workspace and synchronized.
13. Converting from version 5.50 to version > 6.22 SP1

When converting a project from version 5.50 to a later version, note the following:

**GENERAL**

- **Writing the set value and combined element:**
  After conversion, the *Write set value* property is activated for all combined elements. Because this property does not exist in version 5.50, the conversion must be manually deactivated again for each combined element after conversion.

- **Copying projects:**
  When copying projects in version 5.50, the same GUID are in the *project.ini* file. The first project here would be overwritten in the conversion.
  Solution: Delete the INI entry before conversion. This ensures that another GUID number is not issued during conversion.

- **Switch graphics files to invisible:**
  If a graphics file in a combined element is to be invisible in a certain status, no graphics file was selected in version 5.50. After conversion, a rectangle is displayed in the combined element, because the *Transparent* property was not activated.
  Solution: Activate the *Transparent* property for the graphics file. This enables you to have the same functionality.

- **Names for screens:**
  Allowed are: numbers, letters and the following special characters: $, -, @, _, {, }, ~, !, (), umlauts and all other special characters in screen names must be removed before conversion.

**RECIPEGROUPS AND WINDOWS CE**

When converting a project of version 5.50 with active property *Windows CE project* to a version higher than 6.22SP1, recipe groups are not converted to the higher version.

**Background:** With active property *Windows CE project* the saving type is set to binary before the RGM database is converted. Thus no new recipe groups can be created in the new version.

**Solution:** Deactivate property *Windows CE project* before the conversion.
For this you can either:

- open the project in the Editor of version 5.50 and deactivate the property
  or
- change the respective entry in the INI file of the project. To do this:
  - open the `projectname.ini` of the project
  - go to area `[RT]`
  - set entry `WIN_CE=0`

14. Converting from version x to 6.21

14.1 zenon web client CAB files are no longer available

The automatic installation of the zenon web clients via CAB file is no longer possible due to security restrictions by Windows VISTA/7.

15. Converting from version x to 6.22

15.1 Function authorizations for Acknowledging Alarms

Since zenon version 6.22, the existing function authorizations for acknowledging alarms in the project properties are replaced by three new authorizations. The old function authorization 'Acknowledge alarms' no longer exists.

When converting from existing projects, the new function authorizations are configured according to the old single authorization. For example, if the authorization group 15 used to be necessary for the function authorization 'Acknowledge alarms', it is now also necessary for the three new functions.
For the Editor backward compatibility it may be necessary to transfer the authorization group from the three new function authorizations to the old function. The highest authorization group will be used for that. This means, if the function 'Acknowledge alarm via alarm status line' has authorization group 5, 'Acknowledge alarm via screens' has authorization group 2 and 'Acknowledge alarm via function' has authorization group 12, the function 'Acknowledge alarm' of older versions will receive the authorization group 12.

**Information**

Notice regarding online compatibility in the Runtime: If you start a project older than zenon version 6.22 with the current version, the system will offer you the three new functions for configuration. However, only the highest authorization group will be used for processing, according to the mechanism described above. The old project will not be able to use the new functionality.

15.2 Report Generator function fixed

The `fixed()` function also has the argument `no_seps` in versions up to 5.50. The argument is optional and controls the display of thousand separators.

This argument has no longer an effect on the display as thousands separators are no longer used in zenon.

15.3 VBA - Direct variable access via request is no longer possible

VBA gives our customers a powerful tool for project design. Practical experience has shown that access on variables via VBA often leads to mix-ups in the use of the methods “Advise” via an online container and “Request” with direct call. Too many requests can slow down communication significantly.

We have therefore decided to meet the demands of our customers by closing this error source. From now on, variables can only be addressed via “Advise” in VBA.

For existing projects, this leads to certain incompatibilities. You will be affected if you address variables via “Request” in VBA. In this case you will have to change these projects. After making these adjustments you will profit from an increased communication performance.
**NEW:**

Direct VBA read access on variables is only possible if the variable has been registered in the driver (advised) and if it has a value, i.e. if IsOnline() is true. Simple spontaneous queries (requests) are no longer possible.

The following functions of the “Variable” object return an error if this is not the case:

- `Value`
- `StatusValue`
- `StatusExtValue`
- `StatusString`
- `LastUpdateTime`
- `LastUpdateTimeMilliSeconds`

This means that existing projects will no longer run in the Runtime after the conversion, as the functions mentioned above will fail.

Possible solutions:

- Define an online container for all affected variable accesses.
  Advantage: The variables will only be requested if you really need them.
  Disadvantage: Increased programming effort.

- Set the option “DDE active” in the group “Additional settings” of the variable properties for all affected variables.
  Advantage: Easy to perform.
  Disadvantage: The driver continuously requests all variables.

---

**Attention**

*Limited compatibility!*

*After a project conversion to the current version, please check whether there is direct access on variables in any Runtime VBA macro. If this is the case, you must perform the measures mentioned above!*
15.4 RGM database changed

In 6.22 SP1 the format of the used databases for data storage was modified. This means that when converting a project in the Editor the database is modified automatically.

If you changed data of the RGM in the Runtime, you must carry out the following steps:

1. Start the Editor in the original version before you convert the project.

2. In the project properties RT changeable data make sure that the data of the RGM can be read back and decompiled.

3. If you use the Runtime on a remote system: Establish a connection to the remote system and read the Runtime files back. You can find this function in the Remote Transport toolbar.

4. Read the Runtime data back to the Editor. Use command Import Runtime Data in the toolbar Runtime files in order to do so.

5. Close the old Editor and open the new Editor. Now you can convert the project to the new version safely. All data are available in the new version.

⚠️ Attention

Older RGM database from lower versions than 6.22 SP1 cannot be read in Runtime 6.22 SP1 or higher! If you do not convert the data as described using the Editor, you will lose all changes you made to recipes and recipe groups in the Runtime.

WINDOWS CE

If you convert a project with activated option Windows CE project, the data are saved automatically binary in zenon 6.22. This means that when opening the RGM it looks like all recipes are gone.

15.5 Template - maximum name length

Template names may have a maximum of 29 characters. In a previous version, it was possible to create names with 30 characters. Before converting a project, all template names with 30 characters must be reduced to 29 characters.
16. Converting from version X to version 6.50

Projects from older versions are automatically converted when loaded into the current editor. A backup of the project is automatically created in the directory `\SQL\Backup`.

⚠️ **Attention**

*Before converting the editable data into Runtime editor, read it back into the old version. Otherwise it will be lost!*

16.1 straton

When converting from straton projects, the following must be taken into account:

⚠️ **Attention**

The following applies for straton:

- All projects must be recompiled after conversion into Workbench, so that they work in straton Runtime.
- Projects from an older version which have not been converted to version 6.50 cannot be started with Runtime version 6.50.

16.2 Extended graphical settings for AML and CEL

As of version 6.50 property *Extended graphical settings* is available for control element alarm message list in screen Alarm Message List (AML) and control element event list for screen Chronological Event List (CEL).

It activates the use and the customization of the horizontal and vertical scroll bars, the header and the grid for the control element via the corresponding properties in group *Header and grid.*
If projects from earlier version are converted to version 6.5x, property Extended graphical settings is missing. To access the property, you must delete control element Alarm Message List or Event List from the screen and create it again.

16.3 Status bits - new short name

Short names for status bits differ since version 6.20 in the different languages. With zenon version 6.50, common short names were introduced. To ensure compatibility with earlier versions, the short names can be changed to the previous ones in project.ini. In this chapter, you will find:

1. List of new short names including comparison to previous short names
2. List of short names with long name
3. Instruction to reactivate the old short names in project.ini
1. NEW SHORT NAME STATUS

**Information**

In formulas all status bits are available. For other use the availability can be reduced.

### 3. ACTIVATION OF OLD SHORT NAMES

If you wish to use the language-dependent short names as in versions before 6.50, you can enable this with an entry in `project.ini`. The first short names apply for:

- VBA
- Recipegroup Manager
- Combined element dialog
Reaction matrix dialog

**Note:** The short name must be entered in capital letters, must not contain any spaces and must contain a maximum of 7 characters.

**THIS IS HOW YOU OPEN PROJECT.INI**

1. select the project in Project Manager
2. press shortcut Ctrl+Alt+E
3. the SQL folder of zenon opens in the Windows Explorer
   C:\ProgramData\COPA-DATA\[SQL folder]\\[UID]\FILES
4. navigate to \zenon\system\
5. open the file project.ini with a text editor.

**ASSIGNMENT OF NEW LANGUAGE DEPENDENT SHORT NAMES**

Copy the entry of the desired language from [STATUS] up to and including STATUS63=RES63 and paste this into project.ini.

16.4 Structures for UDFBs in straton

As of version 6.50 in zenon the straton UDFB data types are no longer available. To preserve the compatibility with version 6.22, you can create them in zenon with a project prefix: "PROJEKTNAMEND/UDFBName". For this to work you must add an entry in file K5DBXS.ini:

1. open file K5DBXS.ini
2. go to area [XS]
3. create entry UseUDFBPrefix=1

When you have questions concerning the adaption of invisible UDFBs please contact support@copadata.com or the hotline mentioned in your support contract.

16.5 VSTA and VBA - naming of objects

Some changes to the object model have been made due to limitations in naming VSTA objects. These changes have an effect on VBA code because this continues to access the old name and therefore no longer work.

The following changes have been implemented:

- IDriver
  - Name -> Identification:
    The Name property does not receive the name returned, but the driver identification. It was renamed in Identification.
  - Driver -> Name:
    Driver is incompatible with VSTA, because this property returns the name of the driver. It is renamed in Name.

- IApplication
• **Close** -> Method: **Close** / Event: **OnClose**:

  `IApplication` has both a method as well as event with the name `Close`. This is not compatible with VSTA. The event was renamed in `OnClose`.

• **IZenWorkspace**

  • **Startup** -> **OnWorkspaceStartup**
  • **Exit** -> **OnWorkspaceExit**

Because both these names are used for VSTA internal events, they were changed to `OnWorkspaceStartup` and `OnWorkspaceExit`.

⚠ **Attention**

*Check the VBA code for changed names and adapt it to the new model accordingly.*

17. **Converting from version x to 6.51**

Projects from older versions are automatically converted when loaded into the current editor. A backup of the project is automatically created in the directory `\SQL\Backup`.

⚠ **Attention**

*Measures to carry out before conversion:*

Before converting the editable data into Runtime editor, read it back into the old version. Otherwise it will be lost!

17.1 **Calculation column width**

As of version 6.51 the average character width of the selected font is used to calculate the column width (e.g. Alarm Message List or CEL). Before that a default value was used. This may cause columns to be displayed in other widths than expected after the conversion.
### 17.2 Settings SQL database

As of version 6.51 the SQL instance can be defined and the password is saved in an encrypted form in the Startup Tool.

For this the Dialog for setting database properties was changed. New entries have a higher priority than existing entries. The display of the dialog is automatically adopted to the selected version (previous 6.51, as of 6.51).

**NEW ENTRIES**

zenondb.ini contains new entries as of version 6.51:

```
[CONNECTION_SQL2005]
USER=zenOnSrv
PW=0x9C 0x94 0xC6 0x50 0x15 0x80 0x79 0x06 0x32 0xED 0xE1 0xDD 0x90
SQLINSTANCE=COMPUTERNAME\ZENON_DEV
```

These entries replace entry:

```
[CONFIG]
PROVIDER_SQL2005
```

If the new entries are not available or empty, this entry is still used.

**COMPATIBILITY**

As long as no property is changed, the existing entries remain valid. If you change an entry for version 6.51 or higher, the new entries are valid. Older versions must be maintained separately. You can find the settings for version previous to 6.51 in chapter Database previous version 6.51.

**Attention:** As the encrypting of the user password is now taking place in the new dialog in the Startup Tool, as of version 6.51 all settings must be made via the Startup Tool.

### 17.3 Extended Trend XY axis

Due to performance reasons archive data for the X axis are no longer loaded automatically in the Extended Trend diagram as of version 6.51. To display the X-axis in the diagram anyway:

- Add the variable selected for the variable for X-axis as well as the curve in the diagram
Deactivate the display for this curve

17.4 GUID for project conversion for version 5.50

At the conversion of projects of version 5.50 take care that when converting several projects an individual GUID is created for each project.

REASON

In the project.ini of version 5.50 there is the entry **GUID** which contains a project GUID. If you convert a project to version 6.x, this GUID is used.

In zenon 5.50 it was possible to copy folders on file level, then open the project in the Editor and rename it. This project copy still contained the original GUID in the INI file which was no problem for 5.50.

If you convert two such projects in version 6.x, the conversion for the second project is canceled with the note that the GUID already exists.

SOLUTION

For converting several copied projects from 5.50 there are three possibilities:

1. **Save as**
   - Convert project A
   - execute "Save project as" in version 6.x
   - a new GUID is created
   - delete original project
   - convert project B

   **Attention:** This method is not suitable for global projects.

2. **Project backup**
   - Convert project A
   - create project backup in version 6.x
   - delete original project
• Restore backup via "Restore project backup" and at that activate property "Create new project".

Note: This method is also suitable for global projects.

3. editing project.ini
   • open project.ini of version 5.50 In this version "project.ini" is called projectname.ini
   • delete the entry with the GUID
   • convert
   • a new GUID is created

Note: If this project is opened again with version 5.50, a new GUID is also created and entered in the INI file.

17.5 Clickable buttons combined element

As of version 6.51 you can create clickable buttons in the combined element for option Symbol from library in any from.

For projects for earlier versions, the property Symbol form defines the click area (node: Display) is treated as inactive.

17.6 Context menus command

Previous to version 6.51 text at automatic menu items was ignored. At converting projects which were created with earlier versions than 6.51 Macros $ALL$\$NOTE$ are automatically inserted before the engineered text. Therefore the menu items behave as before.

17.7 Record shift times in the PFS

At recording shift times in the Production & Facility Scheduler the table name for the recording was fixed to PFSSHIFTHISTORY in version 6.50.

As of version 6.51 it is created after the following pattern: ProjectGUID\_SHIFT\_GUID of the equipment group
For example:
292af0ac-d33d-4123-8484-e359cd0a6ae3_SHIFT_989ef705-d6a6-4b81-9eb5-f76483ecaac1.

17.8 Convert symbol colors of the general symbol library from color palette to absolute color

When using palettes, only the palette index is saved. The actual color is assigned in Runtime.

PROBLEM
If you define colors for symbols of the general symbol library via palettes (similar to function as palette as of 6.51) in versions earlier than zenon 6.51 and the colors of a symbol are changed in version 6.51, all user-defined colors of the symbols are adapted to the change when the Editor is restarted. This action is correct from compatibility's point of view. However absolute colors can be necessary.

SOLUTION
If the symbol library is saved again in zenon 6.51, the palette indices are saved as absolute colors.

Procedure:

1. Activate and open the project with the correct palette in zenon 6.51.
2. Add a new symbol to the general symbol library.
3. Save the general symbol library. It is saved in the new format.
4. Close the Editor and restart it.
5. Rename the newly created symbol and save it.
6. In the global symbol library the palette colors are replaced by the absolute colors.

17.9 Wizards - remove VBA/VSTA properties

At filtering for screen switch functions to a screen of type Extended Trend, the following dynamic properties were removed as they no longer have a function:
Converting from version X to version 7.00

- `PictFilter[0].Curve["0 "].VarInfo.Channel`
- and `ArvName`, `Titel`, `Group` and `Amplitude` of the same object

If you use these properties in a wizard, you must remove them.

17.10  Character # not allowed in object name

As of version 6.51 character `#` is no longer valid for object names such as variables or functions. The character cannot be entered when giving the name via the user interface.

**Background:** A `#` in the name may for example cause problems during the import.

18. Converting from version X to version 7.00

Projects from older versions are automatically converted when loaded into the current editor. A backup of the project is automatically created in the directory `\SQL\Backup`. The automatically-generated backups have the SQL Server used in the filename from version 7.00 onwards, for example: `before converted to 7.00 SP0 (sql server 2008 r2).zip`

⚠️ **Attention**

*Measures to carry out before conversion:*

*Before converting the editable data into Runtime editor, read it back into the old version. Otherwise it will be lost!*

18.1 User administration with Active Directory

From version 7.00 SP0 on Active Directory is only available for the user administration in the zenon Runtime. This means for the zenon Editor:

- AD users are not used for the Editor.
- AD users are no longer validated in the Editor.
Via AD log in to the Editor is not possible.

**Attention:** If you implemented the log in to the zenon Editor via Active Directory in a project, you must create a zenon user with all necessary rights before you convert the project.

### 18.2 Installation of version 7.x and version 6.51 on the same computer

If a version 7.x is installed on a system that already has zenon 6.51 installed, the **Multiple Network Protocol Driver** must be reinstalled after a reboot.

For that

1. Restart the system
2. On the installation medium, open the path `Additional_Software\COPA-DATA\Multiple Network Protocol Driver x64`
3. Execute the file `setup64.exe` (*setup32.exe* on 32-bit systems from the path `Additional_Software\COPA-DATA Multiple Network Protocol Driver x86`)

This means that the driver is reinstalled and properly linked to the network card.

### 18.3 Diagnosis Server with new service

With zenon 7.00 SP0 the diagnosis system adapted. From this version on all logging tasks are carried out by service `zenLogSrv`. The service `zenSysServ` is now only responsible for Remote Transport activities.

The maximum number of modules per Diagnosis Client was increased from 32 to 64.

That means:

- Diagnosis systems up to version 6.51 and from version 7.00 are each compatible among themselves.
- The diagnosis mechanism of zenon 6.51 SP0 and zenon 7.00 SP0 are not compatible.
Converting from version X to version 7.00

<table>
<thead>
<tr>
<th>Compatibility</th>
<th>Diagnosis Server 6.51 SP0 and earlier</th>
<th>Diagnosis Server 7.00 SP0 and higher</th>
</tr>
</thead>
<tbody>
<tr>
<td>Diagnosis Client 6.51 SP0 and earlier</td>
<td>compatible</td>
<td>incompatible</td>
</tr>
<tr>
<td>Diagnosis Viewer 6.51 SP0 and earlier</td>
<td>compatible</td>
<td>incompatible</td>
</tr>
<tr>
<td>Diagnosis Client 7.00 SP0 and higher</td>
<td>incompatible</td>
<td>compatible</td>
</tr>
<tr>
<td>Diagnosis Viewer 7.00 SP0 and higher</td>
<td>incompatible</td>
<td>compatible</td>
</tr>
</tbody>
</table>

With the Diagnosis Viewer version 7.00 SP0 and higher you can open log files which were created by Diagnosis Server version 6.51 SP0 (or earlier). It does not work the other way round.

### 18.4 Dynamic Combo/List Box

As of version 7 combo/listboxes can also be created dynamically. Via property `Entries from string variable` you define whether the entries in the box are created in the Editor or via a linked string variable.

At converting projects from a version older than zenon 7, the new properties are assigned with valid values:

- **static combo/listbox** (property `Entries from string variable inactive`)
- **no visibility variable** (property `Variable empty`)

If files for an older version are created or saved, the properties for the dynamic comb/listbox are not loaded in order to ensure backward compatibility.

### 18.5 IPv6

As of zenon version 7 you can use IPv6 in the network.

The zenon network allows the choice of using IPv6 or IPv4. Dual operation is not possible. The setting is made via:

- Network configuration in the Startup Tool
  - or
  - in zenon6.ini
**Attention**: IPv6 only works with version 7 onwards. No versions prior to version 7 can be started if this is active. This concerns zenAdminSrv, zenSysSrv, zenLogSrv and zenDBSrv in particular.

The following components are not affected by the setting; they always use IPv4:

- Driver communication with the PLCs
- Protocol communication in the Process Gateway plug-ins
- Workbench and Runtime communication in straton

**DIAGNOSIS VIEWER**

The Diagnosis Server also works with Diagnosis Clients which addresses via IPv6 addresses. For this the format of the log file has been adapted. The Diagnosis Viewer only reads the new format of the log files. If files from older zenon versions are opened (or vice versa), the IP address of the Diagnosis Client is not displayed correctly.

### 18.6 Licensing

With version 7.00 licensing is adapted. To adapt existing zenon version to version 7.00, you must purchase a license for version 7.00 and enter the new activation number. The serial number remains the same.

The entries in zenon6.ini are now:

```
[DEFAULT]
SERIAL7=
ACTIVATIONKEY7=
```

### 18.7 Message Control

As of version zenon 7.00 SP0 module Message Control differs basically from earlier versions in terms of technology and configuration.

Important technical changes:
• COM Server is no longer used
• the additional component of company DerDack is no longer used
• the ZenMsgQueue is replaced by an own screen of type Message Control
• the configuration is carried out in property Message Control of the workspace (sending) and properties Project-specific settings for module Message Control in the project (project-specific)
• there is no detail view anymore
• the shift model and the calendar functionality has been removed
• there are no Runtime changeable files anymore
• Sending e-mails is possible via Outlook or a SMTP Server whereas SMTP allows the sending of attachments
• the configuration of the sending type is no longer saved in file message32.ini but in file zenon6.ini
• Evaluating the limit texts: Up to now the evaluation of compound texts in module Message Control differed from the evaluation of standard limit texts. From version 7.00 on both are evaluated in the same way. @StringTabelle+%var1

You can find details about the configuration in chapter Configure Message Control.

⚠️ Attention

Only projects from version 5.50 SP7 on can be converted to version 7.

CONVERSION

Due to the profound changes a 100% compatibility cannot be guaranteed for the conversion. This is also true for compiling RT files for older versions. At converting especially take care for:

• User:
  • Users with the same name (first name, last name) existing: User is used and information is added.
  • No according user available: A new user is created. The link to the replacement and to the user group is resolved. The user is added to the existing or at the conversion to the created group.
Converting from version X to version 7.00

- **User groups:**
  - User group with same name exists: User group is used and information is added.
  - No according user group available: A new user group is created.

- **Functions:**
  
  Show recipient-database function was removed.
  This function can no longer be created with the Editor. At the conversion it is not deleted however. Its call up in the Runtime has no effect and creates a log entry.

- **Paging:**
  Paging is no longer available as sending type. Existing functions with sending type **Paging** are changed to sending type **GSM** at the conversion. A message in the output window indicates this. After the conversion you must check the settings of the function.

- **RT changeable files:**
  As the user administration was changed, RT changeable files are no longer used for Message Control. There is no possibility in version 7 to read back old Runtime data. If the Runtime files of a project prior to version 7 are needed, you must read them back in an Editor prior to zenon 7 and then converted (on page 8).

- **Shifts and calendars:**
  The functionality for shifts and calendars was removed. Existing functions with target type **Shift** are changed to target type **Group** at the conversion. However no group is linked. A message in the output window indicates this. After the conversion you must check the settings of the function.

- **SMS-Gateway:**
  As the simple interface does not offer a technical possibility to assign messages distinctly, from version 7 on only the enhanced interface is supported. At conversion you must make sure that the SMS Server from company Dialogs is configured correspondingly. Otherwise the sending fails.

### 18.8  RGM - error behavior at screen switch

If for the screen switch of the RGM a recipe is selected faulty by:

- recipe not available in the Runtime
Converting from version X to version 7.00

- no selection made
- recipe not included in the filter

then the behavior of the drop-down list recipe changes in the Runtime:

- up to version 6.51 SP0 the first recipe in the list is offered
- as of version 7.00 SP0 the selection remains empty.

18.9 Read RGM recipe - new operation

As of version 7.00 SP0 at reading in variable values to recipes (teaching) it is checked:

- whether the values of the properties min. value and max. value have been adhered to.
- which status the variable has.

If the values are gone below or exceeded, or the variable has the status INVALID, the values are no longer written to the recipe and no longer saved.

Additional system variables (sysdrv.chm::/25964.htm) are analyzed. As of version 7.00 possible variable values:

- 0: Set before the reading and only changes when the reading process is done.
- 1: Finished reading successfully.
- 2: During reading an error not defined in greater detail has occurred.
- 3: When reading, at least one variable hat status INVALID (main.chm::/24148.htm).
- 4: At least on value is not within the min-max limits.
- 5: During reading a timeout (30000 + 100*VarCount in [ms]) occurred.

18.10 Driver Allan Bradley RS-Linx

From version 7.00 SP0 the driver supports Unsolicited Messages. With this the configuration of the driver changes. It is now done on the tab.
Converting from version X to version 7.00

- **General**: Unchanged
  Note: If you use Unsolicited Messages, you should deactivate Update time global

- **Configuration (allanbnt.chm::://11111.htm)**: The previous KT number is replaced by the label of the RS-LINX driver.

- **Unsolicited Messages configuration (allanbnt.chm::/33547.htm)**: New. Setting for Unsolicited Messages.

  **Attention**

  In existing projects the driver configuration must be adapted.

---

### 18.11 SQL Server change

With zenon 7.00 SP0, the Microsoft SQL Server 2008 R2 Express is installed and used for zenon projects. The zenon Editor only connects to SQL Server 2008 R2 by default from version 7.00 onwards. Projects that have their databases in a different SQL server instance (such as ZENON_DEV with SQL Server 2005), cannot be opened.

The SQL Server instance that zenDBSrv connects to can be changed using the startup tool. The startup tool sets, in zenDB.ini, the corresponding entries for the respective zenon Version:

- **Before 6.00**: no database
- **6.00 to 6.20**: Entries for SQL Server 2000 (MSDE)
- **6.21 to 6.51**: Entries for SQL Server 2005 Express Edition
  The password is stored in encrypted form with 6.51
- **Version 7.00 and later**: Entries for the SQL Server 2008 R2 Express Edition with encrypted password

Dual operation of SQL Server 2005 instance "ZENON_DEV" and SQL Server 2008 R2 instance "ZENON_2008R2" is not possible.
**Attention**

Projects from previous versions of zenon must be imported in the original version and then restored in zenon 7.00.

*Hint:* If no export has been made and the applicable version is no longer available, the transfer can be made manually:

- Copy the complete folder, including the GUID, to a new location
- Establish the database connection manually

**PROJECT CONVERSION**

The following procedure is recommended for the conversion of projects from versions prior to version 7.00:

1. Create project backups in the version from which they are to be converted.
2. Export project backups to the hard drive.
3. zenon Editor 7.00 Editor.
4. Create new workspace.
5. Read the project backups into the new workspace.

The project backups can also be read back into the same workspace in the 7.00 Editor. Because the GUID remains the same when a project backup is read back, the workspace in zenon 7.00 and in versions between 6.21 and 6.51 can be opened.

**Information**

Although the projects have the same name and the same GUID, projects from zenon 7.00 are independent from projects from zenon 6.21 to 6.51 due to the different SQL server instance. Backups in zenon 7.00 do not appear in versions 6.21 to 6.51 of the Editor. It is therefore recommended that these are stored in a new workspace.
19. Converting from version X to version 7.00

19.1 64-bit version

zenon is now available for Editor and Runtime as a 32-bit and 64-bit version. A 32-bit and a 64-bit zenon Editor and a 32-bit and a 64-bit zenon Runtime are installed on 64-bit operating systems. The file names of the executable files are identical for 32-bit and 64-bit.

On 64-bit systems, all services present in 64-bit are registered and used in the 64-bit version. Editor and Runtime can be started alternately. Projects can be executed in both Editors and in both Runtimes.

Components such as, for example, straton Runtime, straton Workbench, drivers, Process Gateway and other tools are always only used in the 32-bit version.

GENERAL LIMITATIONS

The basic limitation of only 64-bit DLLs being able to be loaded in 64-bit processes also means that there are certain limitations when operating zenon. This mostly affects external components that are loaded in the Editor or Runtime. DLLs that are loaded using VBA/VSTA code and ActiveX controls are directly affected. These DLLs must be present as a 64-bit version for use in the 64-bit Editor or Runtime. ActiveX controls supplied by COPA-DATA are always available in 32-bit and 64-bit versions.

CONVERSION OF ZENON 5.50 PROJECTS

No zenon 5.50 projects can be converted with the 64-bit editor. These must be converted beforehand with the 32-bit Editor.

RGM LIMITATION

The Access database is no longer supported in the RGM. In order to be able to use MS Access data from previous versions under 64-bit, the project must first be converted in the 32-bit Editor. The DataSource property is no longer available from version 7.10. For details, see the Converting Recipegroup manager database (on page 63) chapter.

VBA

VBA was converted to VBA version 7.1. Therefore VBA is also available in zenon 64-bit. If, in the VBA code, Windows API or other imported DLL functions are accessed, these calls must be adapted to 64-bit.
In general, the following applies: A VBA file created with a 32-bit version cannot be used without changes in a 64-bit version.

There are some defines/functions available in VBA in order to write 32-bit and 64-bit compatible code. For example:

```vba
#if Win64 then
   Declare PtrSafe Function MyMathFunc Lib "User32" (ByVal N As LongLong) As LongLong
#else
   Declare Function MyMathFunc Lib "User32" (ByVal N As Long) As Long
#end if
#if VBA7 then
   Declare PtrSafe Sub MessageBeep Lib "User32" (ByVal N AS Long)
#else
   Declare Sub MessageBeep Lib "User32" (ByVal N AS Long)
#end if
```

You can also obtain some useful notes on the porting of VBA 32-bit code to VBA 64-bit from Microsoft:

- Microsoft Office 2010, notes on porting:

- 32-bit and 64-bit declares for API calls: http://www.jkp-ads.com/articles/apideclarations.aspx
  (http://www.jkp-ads.com/articles/apideclarations.aspx)

**COMPONENTS IN 32-BIT ONLY**

The following components are also only available as 32-bit versions on 64-bit computers:

- Some services, such as zensic and zenvnc
- Licensing
- Process Gateway
- Startup Tool
- Windows CE
- Drivers
- straton Runtime and Workbench
19.2 Installation

zenon 7.10 cannot be installed on systems on which the Microsoft SQL Server Data Engine (MSDE) is already installed. This affects all systems on which zenon 6.20 or an earlier version has been installed.

19.3 Batch Control

Before converting a project to the new zenon version, all recipes must be ended. Recipes that are running continue to be executed after a restart. The restart only functions within the same zenon version.

19.4 Conversion of projects in versions up to zenon 6.21

zenon projects in version 6.20 or older can no longer be directly read back in zenon 7.10 or higher.

**Background:** Versions that are based on the MSDE (SQL Server 2000) are not compatible with the SQL Server 2012 used in zenon.

**Solution:** First convert in zenon 7.0 and then in 7.10 or higher.

19.5 Converting Recipegroup Manager database

From version 7.10, the MS Access database is no longer supported in the Recipegroup Manager. When opening an existing project, the data storage is automatically converted to binary data. A project backup is created in the process. This makes it possible for you to open the project with the version in which it was created.

**CONVERSION WITH 64-BIT EDITOR**

The 64-bit Editor cannot access the MS Access database. To convert this, open the project in the 32-bit Editor first. There is a mechanism available that with the RGM setting DataSource:MS AccessDB automatically transfers the data to binary files. The DataSource property is no longer available from version 7.10. If the data storage has already been set to binary files, the database data is rejected. For this, the following applies:
• Copying the data from the Access database to binary data storage only occurs with conversion in the 32-bit Editor. The data from the Access database is always rejected with 64-bit.

• When converting under 64-bit, a check is made to see if the data storage of the RGM is set to MS Access. In this case, corresponding information with notification of conversion is displayed in the 32-bit Editor.

• If, when copying over in the 32-bit Editor, it is established that at the target (binary files) data has already been configured, the user is asked which data is to be kept (MS Access or binary). MS Access and binary data cannot be combined.

After conversion, you can also open and edit the project with the 64-bit Editor.

If you want to convert the project again, use automatically-created backup during the conversion.

### 19.6 SQL Server 2012

The SQL Server is switched to 2012 Express Edition version with zenon 7.10 SP0. The settings are defined with the Startup Tool.

The correct entry for the zenDB.ini can be found in the zenDB.ini chapter.

⚠️ **Attention**

Projects from other versions cannot be opened directly in zenon 7.10. Projects which should be edited in zenon 7.10 must first be edited in the version in which they were created. The project backup can then be converted in zenon 7.10.

If numerous versions are installed in parallel, the various SQL servers must have different paths.
19.7 Report Viewer

TIME DOMAINS

The Report Viewer can use several time domains from version 7.10 and up. For upwards compatibility the first two configured time filters on the list are used.

DATA SETS

The datasets for AM, CEL, ARCHIVE and ONLINE were supplemented with the RESOURCESLABEL entry.

19.8 Direct Daw aus VBA entfernt

All classes, methods and events that are used for direct drawing in zenon screens using the zenon API (VBA/VSTA) were removed for performance reasons. This concerns:

- Draw class
- DrawAPI method
- Draw event

19.9 WPF

The WPF element CircularGauge was expanded from 3 to 6 display areas. Backward compatibility is not guaranteed here.

Note: If two versions of a group file are available in a project, the user is asked which version is to be used. No further actions are needed for the maintenance of the versions used up until now. If a newer version is chosen, all corresponding CDWPF files in all symbols and images in all projects must be adapted.

19.10 Time filter

The configuration and display of the time filter and the filter results have been revised, optimized and harmonized.
The combination of the new Modify time range option and the new filter behavior can lead to the filter results being different in versions 7.10 from previous versions.

20. Converting from version x to 7.11

20.1 Batch Control

DISPLAY COMMAND TAG

With version 7.11, in the Parameter list settings tab in screen switching, the options for Display command parameters have been enhanced and switched to radio buttons with as many combinable check boxes as desired.

In terms of backwards-compatibility, this means that backward-compatible writing is only possible if:

- Only one checkbox is set for the changeable parameters
- or the combination of all checkboxes lets all parameters through

If the combination of the checkboxes results in a setting that was not previously configurable with zenon 7.10 or earlier, no parameters are displayed in the list.

RESTARTING RUNTIME

When restarting after Runtime has been restarted, the respective status is stored with the information in the recipes. The execution status is also displayed in the unit information. The execution status (numerical and text) in the unit information contains a number and text that corresponds to that of the variables in the screen. Including information on whether triggered by a restart, information on objects with a different status and objects that delay a status change.

Caution: The content of these variables is not compatible between zenon 7.10 and 7.11.

20.2 Commands

When creating the Runtime files - via Create all Runtime files - all Auto/Remote command and Forced command actions are filtered out.
These actions are only available in zenon from version 7.11. The Editor compilation validation checks whether, for a variable (or variables when using wildcards) the same command or the same switching direction has been configured twice. If this is the case, a corresponding error message appears in the output window.

**Information**

The Auto/Remote command and Forced command actions are not available in Runtime versions before version 7.11.

## 20.3 Modify variables via API

In the zenon object model, the variable object has been supplemented with the [ModifyVariable](#) and [ModifyArrayVariable](#) functions. Properties of simple variables, structure variables and arrays can therefore be edited via the API. All dynamic properties that cannot be changed via the API have been set to "read only".

- **ModifyVariable** function:
  For simple variables. Allows the modification of:
  - Driver
  - Channel type
  - Data type
  - Addressing mode
  - Each data type starts with new offset setting

- **ModifyArrayVariable** function:
  For array variables. Allows the modification of:
  - Drivers
  - Channel type
  - Data type
  - Addressing mode
  - Calculation of offset
  - Lower bound (0 or 1) and dimensions of the array
Attention: In addition, the following properties have been set to READ-ONLY for the API:

- LBound
- Dim1
- Dim2
- Dim3
- OfsAccordingType
- IsOffsetManuell
- IsStartAtNewOffset
- Driver
- ID_DataTyp
- ID_DriverTyp

20.4 Lot filter

Filtering for lots has been enhanced and the configuration has been harmonized.

COMPATIBILITY

- The Lots setting in the Time tab is now in the Lots tab and is called Display lot selection dialog.
  
  Difference: Up to version 7.11, the dialog could be configured in the time filter with the Lot selection and the filter could be switched in the Lot tab of the filter.
  From version 7.11, only one of the two is possible. When converting a project, the Display lot selection dialog option is selected and the time filter is set to its fixed default value of Relative time filter with one hour.

- Note on XML import: When converting a project from version 7.10 to version 7.11 via an XML export and XML import, there is a visual error. The conversion is carried out for the XML import with absolute time filter with one hour instead of with relative time filter with one hour. This has no effect in Runtime because the setting is not evaluated when the dialog is called up. However when the
filter is opened in Runtime or in the Editor, an error message is displayed, because the start time is later than the end time.

- The possibilities for last lots have been expanded. Completed and ongoing lots can be displayed and both can be combined. If the current lots or the combination of current and completed lots are selected and the project is compiled for a version before 7.11, the completed lots are shown in Runtime.

- The following options are available when filtering for archives and lot names:
  - No filter: Corresponds to the earlier setting * as filter
  - Static:
  - From variable: new setting

When converting from projects created in version 7.10 or earlier, the "*" or empty string setting is converted up as No filter.

- If Runtime files are created for versions before 7.11, only the options no filter and static can be converted correctly. With static, the string is written as it is; with no filter "*" is saved as a filter. The From variable option is ignored; no filter is set.

20.5 Network

VALIDATION DURING COMPILATION

The following validation for an evaluated network is undertaken during project compilation:

- Used variables still exist
- Used variable is not a string variable and not a structure variable
- Hysteresis is within the sum of all weightings
- Used variable is not read by standby server.
- Variables are only checked if the redundancy mode is evaluated.
BACKWARD COMPATIBILITY

- COPA-DATA Runtime can connect to a server with version < 7.11.
- The COPA-DATA Editor can create a project for COPA-DATA Runtime version < 7.11.

20.6  OPC UA Server multi-project compatible

The OPC UA server is multi-project compatible from zenon 7.11 onwards. Variable from the Runtime project and all its subprojects can be selected. In doing so, the object name from the variable name and the project name are combined. Configurations for OPC UA clients that were created before zenon 7.11 are thus not compatible. These must be amended when using zenon 7.11 or higher.

20.7  VBA functions for frame list changed

The functions to query the number of frames has been changed. Up to version 7.10 inclusive, all frames of the local project and the global project have been counted together. From version 7.11, only the frames of the local project or the global project are counted.

The following VBA functions have been changed:

- **CSchabliste::vba_Count()**: As of version 7.11, only provides the number of local or global frames.
- **CSchabliste::vba_Item(const VARIANT FAR & vID)**: As of version 7.11, only iterates the global frame list

These changes can lead to incompatibilities with existing projects. If frames are queried in a project using said VBA functions, these must be adapted.
EXAMPLE

There are frames in local project 5 and global project 10. Then:

- Previously 15 frames were counted and iterated
- From version 7.11, either 5 or 10 frames are counted and iterated
- If the iteration goes beyond the respective size, for example 11, this leads to an error
- Separate queries must be created for the local project and the global project
