ZENON VIDEO-TUTORIALS

You can find practical examples for project configuration with zenon in our YouTube channel (https://www.copadata.com/tutorial_menu). The tutorials are grouped according to topics and give an initial insight into working with different zenon modules. All tutorials are available in English.

GENERAL HELP

If you cannot find any information you require in this help chapter or can think of anything that you would like added, please send an email to documentation@copadata.com (mailto:documentation@copadata.com).

PROJECT SUPPORT

You can receive support for any real project you may have from our Support Team, who you can contact via email at support@copadata.com (mailto:support@copadata.com).

LICENSES AND MODULES

If you find that you need other modules or licenses, our staff will be happy to help you. Email sales@copadata.com (mailto:sales@copadata.com).
2. Equipment Modeling

The Equipment modeling recreates the structure of equipment in the editor. According to standard ISA S88 and S95, you can depict all levels of a company with zenon:

- The upper levels enable details from the lower levels to be classified correctly and to be linked with each other. The lower levels refer to specific equipment which is compiled for process control and process monitoring.

License information

Part of the standard license of the Editor and Runtime.

EQUIPMENT MODELING IN ZENON

With zenon, you can display the overall model and create any desired machines, buildings or processes. Data can be grouped and filtered during run time and in the editor. Equipment models can also be displayed as a separate screen (on page 29) in Runtime and used as a filter for other switched screens. Hierarchical filtering is also supported from zenon 7.60. This means: A variable need only be assigned to one level and it is then automatically incorporated into a filter for higher levels.

Equipment models can be created for all projects in the global project or in individual projects.

Usage:
Editor: Equipment models are used for filtering (on page 36) in the Editor. It is possible to limit (on page 14) things to certain items of equipment when configuring a project. This has no effect in Runtime.

Runtime: In Runtime, the linking is carried out with equipment models when executing functions (on page 37), in order to receive information on certain equipment and to filter online.

Example: Variables: Alarms for certain equipment is filtered out when configuring a project in the Editor. In Runtime, alarms for certain variables are compiled using equipment filters.

**Information**

*The language of equipment modeling cannot be switched.*

**EQUIPMENT MODELING WINDOW**

The equipment models can be opened in a window of their own:

- To do this, select the **Open new window ...** command in the equipment modeling context menu in the project manager.
- A new window with the equipment models is opened by default in the lower area of the editor.
- Like all windows, you can place this window where you like in the Editor.
- If you also keep the detailed equipment modeling view open, the contents of both windows are synchronized, so that you can make changes in both.

### 3. Create equipment model

You can create as many equipment models as you like and group these according to certain criteria. First you create the model, then you create groups.
TO CREATE A NEW MODEL:

- Decide whether you want to create a local or a global equipment model
- in the context menu of node Equipment modeling select command New equipment model
  or, in the Tool bar, reselect the symbol for New equipment model
- In the detail view, a new node with the default name Equipment model X is created (X stands for the serial numbering)
- change the name to suit your requirements. To do this, press the F2 key on the name when highlighted or triple-click on the name field

Information

There are equipment models from global projects and local projects available. In the event of naming conflicts, local equipment projects are preferred.

Hint: Ensure that you use clear names when configuring equipment models. For example, give global equipment models a corresponding prefix or suffix. This way you avoid having the same names in local and global equipment models. And you can easily identify the origin of the displayed equipment model in selection lists.

TO CREATE A NEW GROUP:

- In the context menu of a model or an upper-level grouping, select the New equipment group command
  or press the 'insert' key
  or, in the Toolbar, select the symbol for New equipment group
- In the model structure, a new group with the default name Equipment group X is created (X stands for the serial numbering)
- adapt the name to your needs: The name field is already in edit mode straight after being created. You can subsequently press the F2 key with the name highlighted or click on the name field three times
- you can have as many groups and sub-groups as you like

3.1 Edit equipment model

Groups can be resorted, copied, moved and deleted within a model and throughout all models:
SELECTION

Equipment models and equipment groups can also be selected using multi-select if the elements are:

- on the same level
- within the same model
- and within the same superior group

The selection is carried out with Ctrl+left mouse button clicked.  
Note: With Shift+mouse click you can make a selection of several elements on different levels. The editing possibilities in the context menu and in the toolbar are however deactivated.

DELETE

- highlight the desired node
- select Delete in the context menu or in the toolbar, or press the Del key
- the node and all its sub-groups are deleted

MOVE VIA DRAG&DROP

- highlight the desired node
- hold down the left mouse button
- move the node to the desired area and release the mouse button

SORT VIA DRAG&DROP

- highlight the desired node
- hold down the control key and move the node to the desired position with the left mouse button
- a horizontal line shows the area where you can insert the node

COPY AND PASTE

- highlight the desired node
- select Copy in the context menu or in the toolbar, or press control and C together
- highlight the desired target-node
- select Insert in the context menu or in the toolbar, or press control and V together
- the node being copied is inserted
• sub-nodes are not copied together with the node
• If there is already an element with the same name, Copy of is placed in front of the inserted element

RENAME

To rename models or groups:
1. highlight the model/group
2. press key F2 or perform a triple click on the model/group

After a renaming:
▶ the models are sorted alphabetical again
▶ groups remain in the created structure

⚠️ Attention

The actions delete, resort, move, rename and insert cannot be undone.

4. Link models with elements and objects

Each equipment group can be linked to any desired zenon elements or objects. You have several options for linking a group with an element:

- Via the element's **Equipment Groups** property
- Copy and paste the element into the desired group of the model.
- Drag&drop the equipment group to the element's property **Equipment Groups**.
- Drag&drop the element to the equipment group.

**EQUIPMENT GROUPS PROPERTY**

To link by means of an element's property:

1. Select the element
2. In the **General** node, click on the **Equipment Groups** property.
   The dialog to allocate elements to equipment groups (on page 16) is opened.
3. Allocate the desired equipment groups (for details, see the sub-chapter on Equipment modeling dialog (on page 16)).
Information

No inheritance

If equipment models are selected or created for the configuration of data types, drivers, functions, variables etc. using the Equipment Groups property, they are only used for filtering and are not inherited.

For example: An equipment model selected in a data type is not inherited to variables based on this data type.

COPY AND PASTE

To link using copy and paste:

1. Select the element
2. Copy the element (shortcut Copy or press the ctrl+C keys)
3. Highlight the equipment group you wish to change.
4. Paste the element (shortcut Paste command or press the ctrl+V key)

DRAG&DROP OF THE EQUIPMENT GROUP

To link the equipment group to the element with drag&drop:

1. Select the equipment group.
2. With the left mouse button pressed, drag this to the property Equipment Groups in the element’s node General

DRAG&DROP OF THE ELEMENT

To link the element to the equipment group by drag&drop:

1. Select the element in the project manager detail view.
2. With the left mouse button pressed, drag it to the desired equipment group

Information

With the drag&drop of structure variables, only activated variables are taken into account. Inactive elements are not linked. For closed structure trees check whether all desired variables are active.
4.1 Equipment modeling dialog

In the dialog, you can also allocate an element to a desired equipment group. The dialog opens if you select, in the properties of an element in the General node, the Equipment Groups property:
Option | Description
--- | ---
**Toolbar** | Symbols (on page 19) to:
- Edit local equipment models
- Expand or collapse the display
- Display of information

**List of equipment models** | Provides models and groups for selection. The list separates the display into equipment models from the global project and from local projects.
Local equipment models can be created, edited or deleted (on page 20).

**Add** | Adds the selected groups to the filter list.

**Remove** | Removes all selected groups from the filter list.

**Hierarch filter** | Checkbox for the activation of the hierarchical filtering of the equipment model
- **Activated:** Variables that are linked to a subhierarchy of the selected equipment group are taken into account when filtering and are contained in the display in Runtime.
- **Inactive:** When filtering, only variables that are linked to the selected equipment group are taken into account. Default: **activated**

**Filter list** | Shows all equipment groups that are to be filtered.

---

**CLOSE DIALOG**

**Options** | **Description**
--- | ---
**OK** | Applies settings and closes the dialog.

**Cancel** | Discards the selection and closes the dialog.

**Attention:** Any changes (on page 20) that have been made to the structure of local equipment models are retained.

**Help** | Opens online help.

---

**CONFIGURATION**

New models and groups can be created for the active project and existing ones can be deleted.
ADD MODEL TO PROJECT

To add a new model:

1. Click on the project.
2. In the toolbar select **New Equipment model**

REMOVE MODEL

To remove an existing model:

1. Click on the model.
2. Select **Remove** in the toolbar.

ADD GROUPS TO THE MODEL

To add a group to a model:

1. Select the desired equipment model
   **Attention:** If there are naming conflicts between global and local equipment models, the local equipment models are displayed and the global ones are ignored. You can get information on possible conflicts by clicking on the corresponding symbol (triangle with exclamation mark) in the toolbar.
2. Select an equipment group or level.
3. Add the new group to the list in the lower area of the dialog with the **Add** button.

   Note:
   - Subgroups are not automatically added.
   - It is possible to link as many groups as you want.

REMOVE GROUP FROM THE MODEL

To delete a group from a model:

1. Select the desired elements in the list in the lower area of the dialog (multiple selection is possible).
2. Click the **Delete** button

   **Note:** Changes in a tree element remain preserved independent of clicking button **Cancel**. **Cancel** only means that no element was selected.
FILTER FOR EQUIPMENT GROUPS IN SCREEN SWITCHING

At the screen switch to a screen of type AML, CEL, RGM or Shift management and at function Group/class/area/equipment suppressed (Function group Message Control) you can filter for equipment groups in the filter dialog. You can find instructions at the description of the corresponding dialogs:

- AML Equipment modeling
- CEL Equipment modeling
- RGM Equipment modeling
- Message Control suppress groups/classes/areas/equipment
- Shift Management

4.1.1 Selecting the equipment groups toolbar

Actions in the window of the existing equipment model can be controlled using the toolbar. Description of the symbols, starting from the left:
<table>
<thead>
<tr>
<th>Symbol</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>New Equipment Model</strong></td>
<td>Creates a new Equipment model.</td>
</tr>
<tr>
<td></td>
<td>(for local equipment models only)</td>
</tr>
<tr>
<td><strong>New group</strong></td>
<td>Creates a new equipment group below the highlighted entry.</td>
</tr>
<tr>
<td></td>
<td>(for local equipment models only)</td>
</tr>
<tr>
<td><strong>Edit</strong></td>
<td>Makes it possible to edit the name.</td>
</tr>
<tr>
<td></td>
<td>(for local equipment models only)</td>
</tr>
<tr>
<td><strong>Delete</strong></td>
<td>Deletes the selected entry.</td>
</tr>
<tr>
<td></td>
<td>(for local equipment models only)</td>
</tr>
<tr>
<td><strong>Copy</strong></td>
<td>Copies the selected entry.</td>
</tr>
<tr>
<td></td>
<td>(for local equipment models only)</td>
</tr>
<tr>
<td><strong>Paste</strong></td>
<td>Pastes copied entries from the clipboard below the highlighted entry.</td>
</tr>
<tr>
<td></td>
<td>If a group with the same name already exists, the inserted group receives</td>
</tr>
<tr>
<td></td>
<td>the prefix <strong>Copy of</strong></td>
</tr>
<tr>
<td></td>
<td>(for local equipment models only)</td>
</tr>
<tr>
<td><strong>Attention</strong>: If equipment models are copied from the global project to the</td>
<td></td>
</tr>
<tr>
<td>local project and not renamed, there are two models with the same names. Both</td>
<td></td>
</tr>
<tr>
<td>can be selected, however no linking is created on confirmation.</td>
<td></td>
</tr>
<tr>
<td><strong>Hint</strong>: Always rename models copied from the global project to the local</td>
<td></td>
</tr>
<tr>
<td>project.</td>
<td></td>
</tr>
<tr>
<td><strong>Expand all</strong></td>
<td>All nodes are expanded.</td>
</tr>
<tr>
<td><strong>Collapse all</strong></td>
<td>All nodes are collapsed.</td>
</tr>
<tr>
<td><strong>Expand selection</strong></td>
<td>The selected node is expanded.</td>
</tr>
<tr>
<td><strong>Collapse selection</strong></td>
<td>The selected entry is collapsed.</td>
</tr>
<tr>
<td><strong>Warnings</strong></td>
<td>Displays warnings.</td>
</tr>
<tr>
<td></td>
<td>For example, equipment models from the global project that are not displayed</td>
</tr>
<tr>
<td></td>
<td>because models with the same name from the local project are preferred.</td>
</tr>
</tbody>
</table>

### 4.1.2 Editing local equipment models

Equipment models and equipment groups from local projects can also be edited in the linking dialog. Equipment groups from the global project can only be selected and copied.
The possible actions and editing methods are limited, in contrast to the editing of equipment models (on page 8) in the equipment modeling node. Elements are only edited using the toolbar (on page 19).

**Attention:** Changes to the structure of local equipment model are retained, regardless of whether the dialog is left with OK or Cancel.

The following actions are possible:
Link models with elements and objects

<table>
<thead>
<tr>
<th>Action</th>
<th>Global project</th>
<th>Local project</th>
</tr>
</thead>
<tbody>
<tr>
<td>Create new Equipment model</td>
<td></td>
<td>X</td>
</tr>
<tr>
<td>Create new Equipment group</td>
<td></td>
<td>X</td>
</tr>
<tr>
<td>Change name</td>
<td></td>
<td>X</td>
</tr>
<tr>
<td>delete</td>
<td></td>
<td>X</td>
</tr>
<tr>
<td>Copy</td>
<td>X</td>
<td>X</td>
</tr>
</tbody>
</table>

**Attention:** If equipment models are copied from the global project to the local project and not renamed, there are two models with the same names. Both can be selected, however no linking is created on confirmation.

**Hint:** Always rename models copied from the global project to the local project.

<table>
<thead>
<tr>
<th>Action</th>
<th>Global project</th>
<th>Local project</th>
</tr>
</thead>
<tbody>
<tr>
<td>Paste</td>
<td></td>
<td>X</td>
</tr>
<tr>
<td>Add to filter list</td>
<td>X</td>
<td>X</td>
</tr>
</tbody>
</table>

**Key:**
- -: not possible
- X: possible

### 4.2 List of linked elements

All elements that are linked to the equipment group can be displayed as a list for each equipment group. You can get to the linked element directly using the context menu.

1. Highlight the equipment group you wish to change.
2. In the context menu, select the command **Linked elements...**.

(For details, see the sub-chapter on Linked elements context menu (on page 23)).
The list of linked elements is opened.

In the context menu, you can:

- go directly to the element
- delete the element from the list; the element then loses its link to this equipment group

### 4.2.1 Elements linked to the context menu

In the dialog for linked elements, individual elements can be opened or deleted from the list in the editor by means of the context menu:

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Jump to linked element</strong></td>
<td>goes to the element in the editor, the list remains open</td>
</tr>
<tr>
<td><strong>Delete selected elements</strong></td>
<td>deletes the selected element from the list, the connection to this equipment group is broken</td>
</tr>
<tr>
<td><strong>Help</strong></td>
<td>Opens online help.</td>
</tr>
</tbody>
</table>
5. Hierarchical alarming via equipment groups

The Use hierarchical alarming of the Equipment Model property can be used for the configuration of hierarchical alarm administration.

Alarms can thus:

- Be shown according to locations.
- Be identified according to their original location.
- Be displayed in a hierarchical structure.
- Be easily configured or expanded in the equipment model.

ALARM MESSAGE LIST

In the AML list in Runtime, the entries "Alarm area" and "alarm area number" are empty if hierarchical alarming is activated for the variable.

The sorting according to these two columns only takes the first alarm area into account for variables without hierarchical alarming. Because these columns are empty for variables with hierarchical alarming, they are compiled alphabetically when sorting according to "alarm area" and shown at the top of the list. Also when sorting according to "alarm area number", because the ID for hierarchical alarming is always empty and thus ordered at the top position.

EQUIPMENT MODEL OF THE GLOBAL PROJECT

The equipment groups in the equipment model can be configured in both the global project and the standard project. A variable can use both an equipment group from the global project or from the standard project.

- The configured equipment groups in the global project are also available in the standard project.
- The hierarchical structure of the standard project does not automatically contain the nodes of the global project. Alarm assignments of variables to equipment groups from the global project are taken for the standard project and are then also effective.
- The alarm on the variable is applicable for all traceable alarm areas of the equipment model. In doing so, the equipment group of the variable and the higher-level equipment group of the equipment model are taken into account.
5.1 Engineering in the Editor

To use hierarchical alarming of the equipment model, carry out the following steps in zenon:

1. Model an image of your equipment in the project. This project configuration can be done in both the global project and the standard project.
   a) To do this, select, in the Equipment modeling node, the New equipment model entry
   b) Create a new entry with the symbol or the New equipment group contact menu entry.
      Name each entry with the Name property. Ensure that it has a meaningful name when configuring the project.
   c) Repeat the step for individual elements of your equipment.
      Note the hierarchical structure in the equipment tree.

2. Configure alarm areas:
   a) To do this, change to the Variables node.
   b) Switch to the Alarm sub-node there.
   c) Create a new alarm area:
      To do this, go to the Alarm areas sub-node.
      • Create a new area with the symbol or New alarm area context menu entry.
      Name the entry with the Name property. Ensure that it has a meaningful name when configuring the project.
      a) Assign an equipment group to the alarm area:
      • In the Equipment Groups property, click on the ... button:
        The Select equipment group (on page 16) dialog is opened.
      • Select the desired equipment group and add this by clicking on the Add button.
        Note: Multiple selection is possible. An alarm area is thus added to several equipment groups.
      • Confirm your assignment by clicking on the OK button.
        The alarm group assigned to the equipment group is visible in the Equipment Groups property. With multiple selection, the entries are separated by a semicolon (;).

3. Assign the configured variables an element from the equipment modeling project configuration:
   a) To do this, change to the Variables node.
   b) In the list of configured variables, select the desired variables per equipment group.
      Note: Use the sorting and filter possibilities in the detail view of the project manager.
      For more efficient configuration, you can also use multiple selection.
   c) Switch to the General property group for the selected variable.
   d) In the Equipment Groups property, click on the ... button:
      The Select equipment group (on page 16) dialog is opened.
e) Select the desired equipment group and add this by clicking on the **Add** button.

   **Note:** Multiple selection is possible. A variable is thus added to several equipment groups.

f) Confirm your assignment by clicking on the **OK** button.

   The variable assigned to the equipment group is visible in the **Equipment Groups** property.

   With multiple selection, the entries are separated by a semicolon (;).

   **Hint**

   *Please note that data types inherit the assigned equipment group. The effort required to configure a project can be optimized by means of logical dependencies for project configuration.*

---

### 6. Operating authorization via Equipment model

In the zenon network, operating authorizations can also be configured by means of the equipment model.

As a result, it is possible to give appropriate authorizations to different parts of a plant for different clients.

For this, the following applies:

- The limitation of operation is implemented by means of linking of variables to the equipment model.
- Only the variables that are assigned to an equipment model need operating authorizations for operation.
- Variables that are not linked to an equipment model can always be operated.

**Information**

You can also find further information on operating authorizations in the Operating authorizations in the network chapter in the Network manual.

---

### 6.1 Engineering in the Editor

Carry out the following project configuration in order to use operating authorizations via equipment model:
1. Model your equipment model.

2. Activate the **Equipment model relevant for operating authorization** property. **Note:** You can find this linking in the **General** property group of the equipment model. This property is only available in the uppermost level of an equipment model.

3. Link the configured variables to the respective equipment group.
   The linking is carried out in the **General** variable properties group with the **Equipment Groups** property.

Optional:

1. Configure the variables for the visualization of information in Runtime:
   a) **Available at this computer**
   b) **Operating authorization at computer**

2. Link the variables in the **Operating authorization** properties group to the respective equipment group.

### 6.2 Behavior in the Runtime

The following is applicable in zenon Runtime for operating authorizations via equipment model:

- If no operating authorizations have been configured for the requested item of equipment, operation is possible without restrictions.
- When requesting an operating authorization that has not been issued, the operating authorization is granted automatically.
- If the item of equipment is occupied, it is automatically requested on the corresponding client via the network.
  A corresponding dialog is shown in the Runtime that currently has operating authorizations.
- If several parts of an equipment model are occupied by a client, this is shown on the client that currently has operating authorizations, summarized in a dialog.
- If the operating authorization has been requested for an area and part of it is already occupied, this is automatically requested from the corresponding client via the network. If this is not approved, no authorization is issued, even for areas that would be available.
- Queries to several clients are carried out at the same time.
DIALOG - TRANSFER OPERATING AUTHORIZATION

Parameter | Description
---|---
Yes | The authorization is passed to the client making the request.
No | The operating authorization remains on the current client. The querying client cannot execute the desired action.

7. Export and import models

Equipment models and equipment groups can be imported by means of XML as well as via the API.

⚠️ Attention

The complete equipment model is overwritten on import. Existing equipment models and equipment groups with the same name as imported objects are overwritten on import. Objects that are not contained in the import file are deleted.

XML

EXPORT

To export models:

1. Mark the desired equipment model.
2. Select Export selected as XML... in the context menu or the tool bar. Alternatively select Export all as XML in the context menu.
3. The dialog for selecting a save path is opened
4. Select the save location and name.
5. The selected models or all models are exported by clicking on OK.
6. The success of the export or possible errors are displayed in the output window.
IMPORT

To import models:

1. select *Import XML...* in the context menu or in the toolbar
2. The dialog to open an XML export file is opened.
3. Select the desired XML file.
4. Clicking on **OK** imports the models and groups contained in the XML file.
5. The success of the export and possible errors are displayed in the output window.

API

The following methods are used for import and export via VBA/VSTA:

- **Export**: `SystemModelManager.Export`
- **Import**: `SystemModelManager.Import`

8. Screen of type Equipment model

With an equipment model screen, the following is possible in Runtime:

- Other, already-open screens can be filtered for certain equipment groups.
- All functions linked to a certain equipment group are automatically listed consecutively.

Filtering for an equipment group always has an effect on the screens that have already been opened. If screens are called up again or reloaded, they are displayed again without the equipment model screen filter.

**Note**: With the *hierarchical filter* option, it is sufficient if the variable a variable is linked to a level of the equipment model. This variable is automatically taken into account when filtering at superordinate levels.

**Information**

*Screens that display data from the AML, CEL, RGM or Shift management can be filtered.*

*Faceplate screens can also be selected. However if these do not contain any data from the AML, CEL, RGM or Shift management, they are ignored in Runtime.*
8.1 Creating a screen of the type Equipment model

ENGINEERING

Steps to create the screen:

1. Create a new screen:
   In the tool bar or the context menu of the Screens node, select the New screen command. An empty Standard screen is created.

2. Change the properties of the screen:
   a) Name the screen in the Name property.
   b) Select Equipment Model in the Screen type property.
   c) Select the desired frame in the Frame property.

3. Configure the content of the screen:
   a) select menu item Control elements from the menu bar
   b) Select Insert template in the drop-down list. The dialog to select pre-defined layouts is opened. Certain control elements are inserted into the screen at predefined positions.
   c) Remove elements that are not required from the screen.
   d) If necessary, select additional elements in the Elements drop-down list. Place these at the desired position in the screen.
4. Create a screen switch function.
### Control elements

<table>
<thead>
<tr>
<th>Control elements</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Insert template</strong></td>
<td>Opens the dialog for selecting a template for the screen type. Templates are shipped together with zenon and can also be created by the user. Templates add pre-defined control elements to pre-defined position in the screen. Elements that are not necessary can also be removed individually once they have been created. Additional elements are selected from the drop-down list and placed in the zenon screen. Elements can be moved on the screen and arranged individually.</td>
</tr>
</tbody>
</table>

### CONTROL ELEMENTS

<table>
<thead>
<tr>
<th>Control element</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Equipment Model (label)</strong></td>
<td>Text field to display the name of the equipment model shown in the screen. <strong>Note:</strong> Element of the type Dynamic text. Functionality is assigned using the Screen type specific action property.</td>
</tr>
<tr>
<td><strong>Equipment model (structure)</strong></td>
<td>Tree element that display the group structure of the selected equipment model.</td>
</tr>
</tbody>
</table>

### SELECTION

Buttons for the selection of the display in Runtime.

<table>
<thead>
<tr>
<th>Control element</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Apply selection</strong></td>
<td>The group selected in the tree is used as a filter (on page 41) for the screens selected in the screen switching. The screen must already be open for the filter to work.</td>
</tr>
<tr>
<td><strong>Expand all</strong></td>
<td>All nodes of the tree are expanded and all subgroups are displayed.</td>
</tr>
<tr>
<td><strong>Collapse all</strong></td>
<td>All expanded nodes are collapsed. Only the main groups of the tree are displayed.</td>
</tr>
<tr>
<td><strong>Expand selection</strong></td>
<td>The selected node of the tree is expanded.</td>
</tr>
<tr>
<td><strong>Collapse selection</strong></td>
<td>The selected node of the tree is collapsed.</td>
</tr>
<tr>
<td><strong>Hierarchic filter</strong></td>
<td>Checkbox for the activation of the hierarchical filtering of the equipment model</td>
</tr>
</tbody>
</table>

  - **Activated:** Variables that are linked to a subhierarchy of the selected equipment group are taken into account when filtering and are contained in the display in Runtime.
  - **Inactive:** When filtering, only variables that are linked to the selected equipment group are taken into account.
equipment group are taken into account.

| Execute functions | All functions of the local project that are currently linked (on page 14) to the group selected in the tree are executed. The order of execution is not determined. **Note:** The configuration of the **hierarchical filter** option has no effect on the execution of the function. |

**COMPATIBLE ELEMENTS**

Control elements that are replaced or removed by newer versions and continue to be available for compatibility reasons. These elements are not taken into account with automatic insertion of templates.

<table>
<thead>
<tr>
<th>Control element</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Equipment Model (label)</td>
<td>Static Win32 control element. Was replaced by a <strong>dynamic text</strong> field. For the description, see current element.</td>
</tr>
</tbody>
</table>

### 8.2 Screen switch to a screen of type Equipment model

To create a function to switch to an equipment model screen:

1. Select **New function**.
2. Select **Screen switching**.
3. **Select the** Equipment Model screen
   
   The dialog for configuration is opened.
4. Configure the equipment model to be displayed and the screen that can be updated with it.
5. Confirm the configuration by clicking on the **OK** button.
### EQUIPMENT MODEL DISPLAYED

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Equipment Model displayed</strong></td>
<td>Selection of the equipment model to be displayed in Runtime.</td>
</tr>
<tr>
<td><strong>Static name</strong></td>
<td>Selection of a model from a drop-down list. The list contains all equipment models contained in the local project and in the global project. In the event of naming conflicts (the same name for a local and a global equipment model) the local equipment model is displayed. All local equipment models and all global equipment models with unique names are always offered.</td>
</tr>
<tr>
<td><strong>Name from variable</strong></td>
<td>The model is read when a screen is switched from the string variables stated here. Clicking on the ... button opens the dialog to select a string variable. If the variable cannot be read in Runtime, the name remains empty. No equipment model is displayed</td>
</tr>
<tr>
<td><strong>Selected equipment group</strong></td>
<td>Selection of a variable to which the selected equipment group in the screen is written in Runtime. Clicking on the ... button opens the dialog to select a string variable.</td>
</tr>
</tbody>
</table>
| **Hierarchic filter**            | Checkbox for the activation of the hierarchical filtering of the equipment model  
  - **Activated:** Variables that are linked to a subhierarchy of the selected equipment group are taken into account when filtering and are contained in the display in Runtime.  
  - **Inactive:** When filtering, only variables that are linked to the selected equipment group are taken into account.  
  
  **Default:** Active  
  **Note:** this checkbox is always activated with new projects. For projects that have been created before zenon 7.60 and converted up to the current version, this option is inactive. |

### SCREENS TO BE UPDATED

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Screens to be updated</strong></td>
<td>Selection of the screens that can be filtered for</td>
</tr>
</tbody>
</table>
equipment models with the equipment model screen in Runtime.

Screens that display data from the AML, CEL, RGM or Shift management can be filtered. Faceplate screens can also be selected. However if these do not contain any data from the AML, CEL, RGM or Shift management, they are ignored in Runtime.

**UPDATE**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Update</td>
<td>Update mode.</td>
</tr>
</tbody>
</table>
| Update on all monitors     | Active: The screens listed in the Screens to be updated list are searched for on all monitors.  
                             | Inactive: The screens listed in the Screens to be updated list are only searched for on the calling monitor. |
| OK                         | Applies settings and closes the dialog.                                      |
| Cancel                     | Discards all changes and closes the dialog.                                  |
| Help                       | Opens online help.                                                          |

**Note:** This filter can only be configured in the Editor, not in Runtime any more.

### 9. Filter in detail view

It is possible to filter according to equipment groups in Project manager detail view. If these are not yet displayed, select **Filter selection** in the context menu and add **Equipment Groups**.

**To filter:**
- Click on the filter symbol in the **Equipment groups** column header.
- The Selection dialog (on page 16) for equipment groups is opened
- Add the desired filter criteria to the list.
- Only elements linked to the selected equipment groups are displayed in the detail view.

**To reset the filter:**
- Click on the filter symbol in the **Equipment groups** column header.
- The Selection dialog (on page 16) for equipment groups is opened
- Remove the filter criteria from the list.
10. Filtering in the Runtime

To filter for equipment groups in Runtime, you have the following possibilities:

- Define filter when screen switching (on page 37): Create function screen switch (on page 37) to the desired screen and define the filter in tab **Equipment modeling**. In the Runtime the data is displayed in accordance with the defined filter. The **Filter** button must be present to change the filter in Runtime.

- Screen of type Equipment model (on page 41): Create an equipment model screen and allocate it an equipment model when screen switching. You can select equipment groups in Runtime and apply it as a filter to screens that have already been opened. Furthermore, all functions linked to an equipment group can be executed one after the other at the press of a button.

**Information**

*If you activate the hierarchical filter option, all subordinate levels of the equipment model are taken into account when filtering.*

10.1 Filter when screen switching and executing a function

It is possible to filter equipment groups during runtime for the following functions:

- **AML and CEL:**
  - Delete alarms
  - Acknowledge alarms
  - Export AML
- **Message Control:**
  - Group/class/area/equipment suppressed
- **Shift management**
- **Recipe Group Manager**

**FILTERING**

For the filtering via the **Screen switch** function, the result of the filtering the equipment model can depend on the screen type.
Filtering in the Runtime

- Screen switching to a screen of the following type:
  - AML: Alarms are only displayed if their variables are linked to the equipment groups.
  - CEL: Entries are only displayed if their variables are linked to the equipment groups.
  - Recipegroup Manager: Recipe groups are only offered in the drop-down list if they are included in the filter. If new recipe groups are created, these can be connected to existing equipment groups. This newly-created data can be restored again from the runtime files in the editor. In doing so, the linked equipment groups are also restored.
  - Shift management: Only shifts that are linked to the equipment groups are displayed.

Information

If you activate the hierarchical filter option, all subordinate levels of the equipment model are taken into account when filtering.

10.2 Creating a filter

To create function screen switch and to filter on equipment groups:

1. Create a Screen switch function.
2. Select the desired picture.
3. Click on the Equipment modeling tab in the dialog Filter.
4. Select models and equipment groups
5. Confirm with OK.
DIALOG

Note: The respective tabs shown depend on the module in whose context the equipment modeling has been configured.
## EQUIPMENT MODELING

<table>
<thead>
<tr>

<td>Collapse selection</td>
<td>The selected node of the tree is collapsed.</td>
</tr>
</tbody>
</table>
| Hierarchic filter    | Checkbox for the activation of the hierarchical filtering of the equipment model  
- **Activated:** Variables that are linked to a subhierarchy of the selected equipment group are taken into account when filtering and are contained in the display in Runtime.  
- **Inactive:** When filtering, only variables that are linked to the selected equipment group are taken into account.  |
| Execute functions    | All functions of the local project that are currently linked (on page 14) to the group selected in the tree are executed. The order of execution is not determined.  
**Note:** The configuration of the hierarchical filter option has no effect on the execution of the function.  |

COMPATIBLE ELEMENTS

Control elements that are replaced or removed by newer versions and continue to be available for compatibility reasons. These elements are not taken into account with automatic insertion of templates.
Filtering in the Runtime

<table>
<thead>
<tr>
<th>Control element</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Equipment Model (label)</td>
<td>Static Win32 control element. Was replaced by a dynamic text field. For the description, see current element.</td>
</tr>
</tbody>
</table>

**EXAMPLE**

The alarms of hall 3 in a factory are to be displayed.

Engineering:

- Hall 3 is defined as its own equipment group in the equipment model.
- When switching screens to an equipment model screen, the following happens:
  - The equipment model that contains hall 3 is selected
  - The AML screen is selected as the screen to be updated

The following happens in Runtime:

- the Alarm Message List is called up
- the equipment model is called up
- the equipment model is selected with hall 3
- the **Apply selection** button is pressed

the switched AML screen now only shows the alarms that relate to hall 3
