1. Welcome to COPA-DATA help

ZENON VIDEO-TUTORIALS

You can find practical examples for project configuration with zenon in our YouTube channel (https://www.copadat.com/tutorial_menu). The tutorials are grouped according to topics and give an initial insight into working with different zenon modules. All tutorials are available in English.

GENERAL HELP

If you cannot find any information you require in this help chapter or can think of anything that you would like added, please send an email to documentation@copadata.com (mailto:documentation@copadata.com).

PROJECT SUPPORT

You can receive support for any real project you may have from our Support Team, who you can contact via email at support@copadata.com (mailto:support@copadata.com).

LICENSES AND MODULES

If you find that you need other modules or licenses, our staff will be happy to help you. Email sales@copadata.com (mailto:sales@copadata.com).

</tr>
</tbody>
</table>

**DRIVER VERSIONING**

The versioning of the drivers was changed with zenon 7.10. There is a cross-version build number as of this version. This is the number in the 4th position of the file version, For example: **7.10.0.4228** means: The driver is for version **7.10** service pack **0**, and has the build number **4228**.
Expansions or error rectifications will be incorporated into a build in the future and are then available from the next consecutive build number.

### Example

A driver extension was implemented in build **4228**. The driver that you are using is build number **8322**. Because the build number of your driver is higher than the build number of the extension, the extension is included. The version number of the driver (the first three digits of the file version) do not have any significance in relation to this. The drivers are version-agnostic.

---

### 5. Requirements

This chapter contains information on the requirements that are necessary for use of this driver.

#### 5.1 PC

**HARDWARE**

Network card

**SOFTWARE**

TCP/IP network protocol.

Copy the driver file SIMOTION.EXE into the current program directory (unless it is already there) and enter it into the TREIBER_EN.XML file with the tool DriverInfo.exe.

**CONNECTION**

Connection from the PC network card to the network interface of the Simotion PLC.
6. Configuration

In this chapter you will learn how to use the driver in a project and which settings you can change.

Information
Find out more about further settings for zenon variables in the chapter Variables (main.chm::/15247.htm) of the online manual.

6.1 Creating a driver

In the Create driver dialog, you create a list of the new drivers that you want to create.
Parameter | Description
---|---
Available drivers | List of all available drivers. The display is in a tree structure: 
[+] expands the folder structure and shows the drivers contained therein. 
[-] reduces the folder structure 
Default: no selection

Driver name | Unique Identification of the driver. 
Default: Empty 
The input field is pre-filled with the pre-defined Identification after selecting a driver from the list of available drivers.

Driver information | Further information on the selected driver. 
Default: Empty 
The information on the selected driver is shown in this area after selecting a driver.

CLOSE DIALOG

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>OK</td>
<td>Accepts all settings and opens the driver configuration dialog of the selected driver.</td>
</tr>
<tr>
<td>Cancel</td>
<td>Discards all changes and closes the dialog.</td>
</tr>
<tr>
<td>Help</td>
<td>Opens online help.</td>
</tr>
</tbody>
</table>

Information

The content of this dialog is saved in the file called Treiber_[Language].xml. You can find this file in the following folder: C:\ProgramData\COPA-DATA\zenon [version number].

CREATE NEW DRIVER

In order to create a new driver:

1. Right-click on Driver in the Project Manager and select New driver in the context menu. 
Optional: Select the New driver button from the toolbar of the detail view of the Variables. 
The Create driver dialog is opened.
2. The dialog offers a list of all available drivers.

3. Select the desired driver and name it in the **Driver name** input field. This input field corresponds to the **Identification** property. The name of the selected driver is automatically inserted into this input field by default.

   The following is applicable for the **Driver name**:

   - **The Driver name must be unique.**
     If a driver is used more than once in a project, a new name has to be given each time.
     This is evaluated by clicking on the **OK** button. If the driver is already present in the project, this is shown with a warning dialog.

   - **The Driver name is part of the file name.**
     Therefore it may only contain characters which are supported by the operating system.
     Invalid characters are replaced by an underscore (_).

   - **Attention:** This name cannot be changed later on.

4. Confirm the dialog by clicking on the **OK** button.

   The configuration dialog for the selected driver is opened.

   **Note:** The language of driver names cannot be switched. They are always shown in the language in which they have been created, regardless of the language of the Editor. This also applies to driver object types.
DRIVER NAME DIALOG ALREADY EXISTS

If there is already a driver in the project, this is shown in a dialog. The warning dialog is closed by clicking on the OK button. The driver can be named correctly.

<CD_PRODUCNTAME> PROJECT

The following drivers are created automatically for newly-created projects:

- Intern
- MathDr32
- SysDrv

Information

Only the required drivers need to be present in a zenon project. Drivers can be added at a later time if required.

6.2 Settings in the driver dialog

You can change the following settings of the driver:
6.2.1 General

The configuration dialog is opened when a driver is created. In order to be able to open the dialog later for editing, double click on the driver in the list or click on the Configuration property.
<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Mode</strong></td>
<td>Allows to switch between hardware mode and simulation mode</td>
</tr>
<tr>
<td></td>
<td>▶ <strong>Hardware:</strong></td>
</tr>
<tr>
<td></td>
<td>A connection to the control is established.</td>
</tr>
<tr>
<td></td>
<td>▶ <strong>Simulation - static:</strong></td>
</tr>
<tr>
<td></td>
<td>No communication between to the control is established, the values are simulated by the driver. In this modus the values remain constant or the variables keep the values which were set by zenon Logic. Each variable has its own memory area. E.g. two variables of the type marker with offset 79 can have different values in the Runtime and do not influence each other. Exception: The simulator driver.</td>
</tr>
<tr>
<td></td>
<td>▶ <strong>Simulation - counting:</strong></td>
</tr>
<tr>
<td></td>
<td>No communication between to the control is established, the values are simulated by the driver. In this modus the driver increments the values within a value range automatically.</td>
</tr>
<tr>
<td></td>
<td>▶ <strong>Simulation - programmed:</strong></td>
</tr>
<tr>
<td></td>
<td>No communication is established to the PLC. The values are calculated by a freely programmable simulation project. The simulation project is created with the help of the zenon Logic Workbench and runs in a zenon Logic Runtime which is integrated in the driver. For details see chapter Driver simulation (main.chm::/25206.htm).</td>
</tr>
<tr>
<td><strong>Keep update list in the memory</strong></td>
<td>Variables which were requested once are still requested from the control even if they are currently not needed. This has the advantage that e.g. multiple screen switches after the screen was opened for the first time are executed faster because the variables need not be requested again. The disadvantage is a higher load for the communication to the control.</td>
</tr>
<tr>
<td><strong>Output can be written</strong></td>
<td><strong>Active:</strong> Outputs can be written.</td>
</tr>
<tr>
<td></td>
<td><strong>Inactive:</strong> Writing of outputs is prevented.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> Not available for every driver.</td>
</tr>
<tr>
<td><strong>Variable image remanent</strong></td>
<td>This option saves and restores the current value, time stamp and the states of a data point.</td>
</tr>
<tr>
<td></td>
<td>Fundamental requirement: The variable must have a valid value and time stamp.</td>
</tr>
<tr>
<td></td>
<td>The variable image is saved in mode hardware if:</td>
</tr>
<tr>
<td></td>
<td>▶ one of the states $S_{MERKER_1}(0)$ up to $S_{MERKER8}(7)$, $REVISION(9)$, $AUS(20)$ or $ERSATZWERT(27)$ is active</td>
</tr>
<tr>
<td></td>
<td>The variable image is always saved if:</td>
</tr>
</tbody>
</table>
- the variable is of the driver object type **Communication details**
- the driver runs in simulation mode. (not programmed simulation)

The following states are not restored at the start of the Runtime:
- SELECT(8)
- WR-ACK(40)
- WR-SUC(41)

The mode **Simulation - programmed** at the driver start is not a criterion in order to restore the remanent variable image.

### Stop on Standby Server

Setting for redundancy at drivers which allow only one communication connection. For this the driver is stopped at the Standby Server and only started at the upgrade.

**Attention:** If this option is active, the gapless archiving is no longer guaranteed.

**Active:** Sets the driver at the not-process-leading Server automatically in a stop-like state. In contrast to stopping via driver command, the variable does not receive status switched off ([statusverarbeitung.chm::/24150.htm](https://statusverarbeitung.chm::/24150.htm)) but an empty value. This prevents that at the upgrade to the Server irrelevant values are created in the AML, CEL and Historian.

**Note:** Not available if the CE terminal serves as a data server. You can find further information in the zenon Operator manual in the CE terminal as a data server chapter.

### Global Update time

**Active:** The set **Global update time** in ms is used for all variables in the project. The priority set at the variables is not used.

**Inactive:** The set priorities are used for the individual variables.

### Priority

The polling times for the individual priority classes are set here. All variables with the according priority are polled in the set time.

The variables are allocated separately in the settings of the variable properties.

The communication of the individual variables can be graded according to importance or required topicality using the priority classes. Thus the communication load is distributed better.

**Attention:** Priority classes are not supported by each driver For example, drivers that communicate spontaneously do not support it.
CLOSE DIALOG

<table>
<thead>

<td>Opens online help.</td>
</tr>
</tbody>
</table>

UPDATE TIME FOR CYCLICAL DRIVERS

The following applies for cyclical drivers:

For Set value, advising of variables and Requests, a read cycle is immediately triggered for all drivers - regardless of the set update time. This ensures that the value is immediately available for visualization after writing. Update times can therefore be shorter than pre-set for cyclical drivers.

6.2.2 Basic setting
Parameters | Description
---|---
char String without Header | The type of String variables in the PLC S7 String with or without header information:
- Inactive: STRING
- Active: ARRAY (CHAR)
Default: Inactive

</tbody>
</table>

CREATE NEW CONNECTION

Click on button **New**. Enter connection parameters. Click on button **Save**.

COPY CONNECTION

Select the desired connection in the connection list with the mouse. Amend net address and connection parameters. Click on button **Save**.

DISPLAY CONNECTIONS

Select the desired connection in the connection list with the mouse.

EDIT CONNECTION

Select the desired connection in the connection list. Click on button **Edit**. Perform changes and close with **Save**.
7. Creating variables

This is how you can create variables in the zenon Editor:

7.1 Creating variables in the Editor

Variables can be created:
- as simple variables
- in arrays (main.chm::/15262.htm)
- as structure variables (main.chm::/15278.htm)

VARIABLE DIALOG

To create a new variable, regardless of which type:

1. Select the **New variable** command in the **Variables** node in the context menu
The dialog for configuring variables is opened

2. Configure the variable

3. The settings that are possible depends on the type of variables

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Distinct name of the variable. If a variable with the same name already exists in the project, no additional variable can be created with this name. Maximum length: 128 characters</td>
</tr>
<tr>
<td></td>
<td><strong>Attention</strong>: The characters # and @ are not permitted in variable names. If non-permitted characters are used, creation of variables cannot be completed and the <strong>Finish</strong> button remains inactive.</td>
</tr>
<tr>
<td></td>
<td><strong>Note</strong>: For some drivers, the addressing is possible over the property <strong>Symbolic address</strong>, as well.</td>
</tr>
<tr>
<td>Drivers</td>
<td>Select the desired driver from the drop-down list.</td>
</tr>
<tr>
<td></td>
<td><strong>Note</strong>: If no driver has been opened in the project, the driver for internal variables (<em>Intern.exe</em> [<em>Main.chm::/Intern.chm::/Intern.htm</em>]) is automatically loaded.</td>
</tr>
<tr>
<td>Driver Object Type</td>
<td>Select the appropriate driver object type from the drop-down list.</td>
</tr>
<tr>
<td>(cti.chm::/28685.htm)</td>
<td></td>
</tr>
</tbody>
</table>
Creating variables

Data Type
Select the desired data type. Click on the ... button to open the selection dialog.

Array settings
Expanded settings for array variables. You can find details in the Arrays chapter.

Addressing options
Expanded settings for arrays and structure variables. You can find details in the respective section.

Automatic element activation
Expanded settings for arrays and structure variables. You can find details in the respective section.

SYMBOLIC ADDRESS
The Symbolic address property can be used for addressing as an alternative to the Name or Identification of the variables. Selection is made in the driver dialog; configuration is carried out in the variable property. When importing variables of supported drivers, the property is entered automatically.

Maximum length: 1024 characters.

INHERITANCE FROM DATA TYPE
Measuring range, Signal range and Set value are always:

- derived from the datatype
- Automatically adapted if the data type is changed

Note for signal range: If a change is made to a data type that does not support the set signal range, the signal range is amended automatically. For example, for a change from INT to SINT, the signal range is changed to 127. The amendment is also carried out if the signal range was not inherited from the data type. In this case, the measuring range must be adapted manually.
7.2 Addressing

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Freely definable name.</td>

<tr>
<td>Identification</td>
<td>Freely definable identification.</td>
</tr>
<tr>
<td></td>
<td>E.g. for Resources label, comments, ...</td>
</tr>
<tr>
<td>Net address</td>
<td>Network address of variables.</td>
</tr>
<tr>
<td></td>
<td>This address refers to the bus address in the connection configuration of the driver. This defines the PLC, on which the variable resides.</td>
</tr>
<tr>
<td>Data block</td>
<td>For variables of object type <strong>Extended data block</strong>, enter the datablock number here.</td>
</tr>
<tr>
<td></td>
<td>Adjustable from 0 to 4294967295.</td>
</tr>
<tr>
<td></td>
<td>You can take the exact maximum area for data blocks from the manual of the PLC.</td>
</tr>
<tr>
<td>Offset</td>
<td>Network address of variables.</td>
</tr>
<tr>
<td></td>
<td>This address refers to the bus address in the connection configuration of the driver. This defines the PLC, on which the variable resides.</td>
</tr>
<tr>
<td>Alignment</td>
<td>not used for this driver</td>
</tr>
<tr>
<td>Bit number</td>
<td>Number of the bit within the configured offset.</td>
</tr>
<tr>
<td></td>
<td>Possible entries: 0 to 65535.</td>
</tr>
<tr>
<td>String length</td>
<td>Only available for String variables.</td>
</tr>
<tr>
<td></td>
<td>Maximum number of characters that the variable can take.</td>
</tr>
<tr>
<td>Driver connection/Driver Object Type</td>
<td>Object type of the variables. Depending on the driver used, is selected when the variable is created and can be changed here.</td>
</tr>
<tr>
<td>Driver connection/Data Type</td>
<td>Data type of the variable. Is selected during the creation of the variable; the type can be changed here.</td>
</tr>
<tr>
<td></td>
<td><strong>Attention:</strong> If you change the data type later, all other properties of the variable must be checked and adjusted, if necessary.</td>
</tr>
</tbody>
</table>

7.3 Driver objects and datatypes

Driver objects are areas available in the PLC, such as markers, data blocks etc. Here you can find out which driver objects are provided by the driver and which IEC data types can be assigned to the respective driver objects.
7.3.1 Driver objects

The following driver object types are available in this driver:
### Creating variables

#### Driver Object Type

<table>

</tbody>
</table>
Creating variables

### 7.3.2 Mapping of the data types

All variables in zenon are derived from IEC data types. The following table compares the IEC datatypes with the datatypes of the PLC.

<table>
<thead>
<tr>
<th>PLC</th>
<th>zenon</th>
<th>Data type</th>
</tr>
</thead>
<tbody>
<tr>
<td>BOOL</td>
<td>BOOL</td>
<td>8</td>
</tr>
<tr>
<td>SINT</td>
<td>SINT</td>
<td>10</td>
</tr>
<tr>
<td>BYTE</td>
<td>USINT</td>
<td>9</td>
</tr>
<tr>
<td>INT</td>
<td>INT</td>
<td>1</td>
</tr>
<tr>
<td>WORD</td>
<td>UINT</td>
<td>2</td>
</tr>
<tr>
<td>DINT</td>
<td>DINT</td>
<td>3</td>
</tr>
<tr>
<td>DWORD</td>
<td>UDINT</td>
<td>4</td>
</tr>
<tr>
<td>DATE_AND_TIME</td>
<td>DATE_AND_TIME</td>
<td>20</td>
</tr>
<tr>
<td>REAL</td>
<td>REAL</td>
<td>5</td>
</tr>
<tr>
<td>STRING</td>
<td>STRING</td>
<td>12</td>
</tr>
</tbody>
</table>

**Key:**

- X => supported
- -- => not supported

**Data type:** The property **Data type** is the internal numerical name of the data type. It is also used for the extended DBF import/export of the variables.

### 7.4 Creating variables by importing

Variables can also be imported by importing them. The XML and DBF import is available for every driver.

**Information**

You can find details on the import and export of variables in the Import-Export (main.chm::/13028.htm) manual in the Variables (main.chm::/13045.htm) section.
7.4.1 XML import

During XML import of variables or data types, these are first assigned to a driver and then analyzed. Before import, the user decides whether and how the respective element (variable or data type) is to be imported:

- **Import**: The element is imported as a new element.
- **Overwrite**: The element is imported and overwrites a pre-existing element.
- **Do not import**: The element is not imported.

**Note**: The actions and their durations are shown in a progress bar during import.

**REQUIREMENTS**

The following conditions are applicable during import:

- **Backward compatibility**
  
  At the XML import/export there is no backward compatibility. Data from older zenon versions cannot be taken over. The handover of data from newer to older versions is not supported.

- **Consistency**
  
  The XML file to be imported has to be consistent. There is no plausibility check on importing the file. If there are errors in the import file, this can lead to undesirable effects in the project.

  Particular attention must be paid to this, primarily if not all properties exist in the XML file and these are then filled with default values. E.g.: A binary variable has a limit value of **300**.

- **Structure data types**
  
  Structure data types must have the same number of structure elements.
  
  Example: A structure data type in the project has 3 structure elements. A data type with the same name in the XML file has 4 structure elements. Then none of the variables based on this data type in the export file are imported into the project.

**Hint**

You can find further information on XML import in the *Import - Export* manual, in the *XML import* chapter.
7.4.2 DBF Import/Export

Data can be exported to and imported from dBase.

**Information**

*Import and Export via CSV or dBase supported; no driver specific variable settings, such as formulas. Use export/import via XML for this.*

**IMPORT DBF FILE**

To start the import:
1. right-click on the variable list
2. in the drop-down list of **Extended export/import**... select the **Import dBase** command
3. follow the import assistant

The format of the file is described in the chapter File structure.

**Information**

*Note:*
- Driver object type and data type must be amended to the target driver in the DBF file in order for variables to be imported.
- dBase does not support structures or arrays (complex variables) at import.

**EXPORT DBF FILE**

To start the export:
1. right-click on the variable list
2. in the drop-down list of **Extended export/import**... select the **Export dBase**... command
3. follow the export assistant
Creating variables

Attention

DBF files:

- must correspond to the 8.3 DOS format for filenames (8 alphanumeric characters for name, 3 character suffix, no spaces)
- must not have dots (.) in the path name.
  e.g. the path C:\users\John.Smith\test.dbf is invalid.
  Valid: C:\users\JohnSmith\test.dbf
- must be stored close to the root directory in order to fulfill the limit for file name length including path: maximum 255 characters

The format of the file is described in the chapter File structure.

Information

dBase does not support structures or arrays (complex variables) at export.

FILE STRUCTURE OF THE DBASE EXPORT FILE

The dBaseIV file must have the following structure and contents for variable import and export:
Attention

dBase does not support structures or arrays (complex variables) at export.

DBF files must:
- conform with their name to the 8.3 DOS format (8 alphanumeric characters for name, 3 characters for extension, no space)
- Be stored close to the root directory (Root)

Expressions in the column "Comment" refer to the expressions used in the dialog boxes for the definition of variables. For more information, see chapter Variable definition.
7.4.3 Online import

Variables are created with the driver online import. You will find the command in the context menu of the driver in the driver list.

⚠️ Attention

In order for variables to be able to be imported, the following files must be saved in the zenon project:

- *.st
- *.xml

To do this, in the zenon project tree, go to the Files\other node and add both files here.

To import variables, select the desired connection/controller from which the variables are to be created.

With the settings under filter you define which variables should be imported.
Creating variables

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>All Variables (Default)</td>
<td>All variables are imported.</td>
</tr>
<tr>
<td>Only new Variables</td>
<td>Only new variables are imported.</td>
</tr>
<tr>
<td>Only existing Variables</td>
<td>Only variables which already exist in zenon are imported</td>
</tr>
</tbody>
</table>

After confirming the dialog with OK, the STI file of the Simotion Scout is read in and the variables are made available for the import.

![Image of Select Variable dialog]

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Add</td>
<td>Adds all variables marked in the selection window to the import window. Multi-selection is possible via keys Ctrl + mouse click or keys Shift + mouse click.</td>
</tr>
<tr>
<td>Remove</td>
<td>Deletes marked entries from the import window.</td>
</tr>
<tr>
<td>OK</td>
<td>Applies selection for import.</td>
</tr>
<tr>
<td>Cancel</td>
<td>Closes the import window without carrying out an action.</td>
</tr>
</tbody>
</table>

You can find further information in the chapter "Process data model and variable definition" in the zenon online help.

Online Import merging: If a variable that already exists in the zenon project is re-imported, only the address information of that variable will be updated. All other settings will remain unchanged.
7.5 Communication details (Driver variables)

The driver kit implements a number of driver variables. This variables are part of the driver object type Communication details. These are divided into:

- Information
- Configuration
- Statistics and
- Error message

The definitions of the variables implemented in the driver kit are available in the import file `drvvar.dbf` (on the installation medium in the `\Predefined\Variables` folder) and can be imported from there.

**Note:** Variable names must be unique in zenon. If driver variables of the driver object type Communication details are to be imported from `drvvar.dbf` again, the variables that were imported beforehand must be renamed.

*Information*

Not every driver supports all driver variables of the driver object type Communication details.

For example:

- Variables for modem information are only supported by modem-compatible drivers
- Variables for the polling cycle only for pure polling drivers
- Connection-related information such as ErrorMSG only for drivers that only edit one connection at a time

</tbody>
</table>
Creating variables

ConnectionStates STRING 61 Internal connection status of the driver to the PLC.
Connection statuses:
0: Connection OK
1: Connection failure
2: Connection simulated

Formatting:
<Netzadresse>:<Verbindungszustand>;…;…;

A connection is only known after a variable has first signed in. In order for a connection to be contained in a string, a variable of this connection must be signed in once.

The status of a connection is only updated if a variable of the connection is signed in. Otherwise there is no communication with the corresponding controller.

## ERROR MESSAGE

<table>
<thead>
<tr>
<th>Name from import</th>
<th>Type</th>
<th>Offset</th>
<th>Description</th>
</tr>
</thead>
</table>
### 8. Driver-specific functions

The driver supports the following functions:

**BLOCKREAD**

When reading axis variables, a list of variables is queried for each TCP request, if this is possible within a PDU size.

**BLOCKWRITE**

Blockwrite for the driver can be activated by means of its entry in project.ini. Then several values per TCP request are written for both global variables and axis variables. In doing so, an unbroken save block is written for global variables and a list of variable values is sent for axis variables.

</tbody>
</table>
Entry in zenon 6.ini:

```
[SIMOTION]
BLOCKWRITE=1
```

**CHECKSUM**

In the driver configuration, it is possible to give the Checksum (on page 17) of the Simotion program as an option for each connection that is validated when a connection is established. There is no check if the entry is empty. This field is automatically taken from the STI file when variables are imported online.

If the value for the Checksum does not correspond when the connection is established, the connection is closed again and an error message is logged.

**TO-ALARMS**

To be able to evaluate the TO alarms in Runtime, both the STI file and the XML file must be added with the same name under Files/Other and linked in the driver configuration. Message texts are read in the Runtime.

A Message string variable must be created for each connection, for which the incoming event and cleared event contains transient information with the message text including all accompanying values.

**Note:** After each message, a blank string has to be sent to zenon.
Order of receiving alarm messages. Blank String - Message - Blank String

⚠️ **Attention**

In order for several CPUs to work per STI/CML file, the connection name in the driver configuration must correspond to the CPU name in the STI/CML file.

9. **Driver commands**

This chapter describes standard functions that are valid for most zenon drivers. Not all functions described here are available for every driver. For example, a driver that does not, according to the data sheet, support a modem connection also does not have any modem functions.

Driver commands are used to influence drivers using zenon; start and stop for example. The engineering is implemented with the help of function **Driver commands**. To do this:
- create a new function
- select Variables -> Driver commands
- The dialog for configuration is opened

<table>
<thead>
<tr>

<td>Write set value to a driver is prohibited.</td>
</tr>
<tr>
<td>Establish connection with modem</td>
<td>Establish connection (for modem drivers) Opens the input fields for the hardware address and for the telephone number.</td>
</tr>
</tbody>
</table>
**10. Error analysis**

Should there be communication problems, this chapter will assist you in finding out the error.

**10.1 Analysis tool**

All zenon modules such as Editor, Runtime, drivers, etc. write messages to a joint log file. To display them correctly and clearly, use the Diagnosis Viewer (main.chm::/12464.htm) program that was also installed with zenon. You can find it under Start/All programs/zenon/Tools 7.60 -> Diagviewer.

zenon driver log all errors in the LOG files. LOG files are text files with a special structure. The default folder for the LOG files is subfolder LOG in the folder ProgramData. For example:

```
%ProgramData%\COPA-DATA\LOG.
```

**Attention:** With the default settings, a driver only logs error information. With the Diagnosis Viewer you can enhance the diagnosis level for most of the drivers to "Debug" and "Deep Debug". With this the driver also logs all other important tasks and events.

In the Diagnosis Viewer you can also:

- Follow newly-created entries in real time
- customize the logging settings
- change the folder in which the LOG files are saved

**Note:**

1. The Diagnosis Viewer displays all entries in UTC (coordinated world time) and not in local time.
2. The Diagnosis Viewer does not display all columns of a LOG file per default. To display more columns activate property **Add all columns with entry** in the context menu of the column header.

3. If you only use **Error-Logging**, the problem description is in the column **Error text**. For other diagnosis level the description is in the column **General text**.

4. For communication problems many drivers also log error numbers which the PLC assigns to them. They are displayed in **Error text** or **Error code** or **Driver error parameter (1 and 2)**. Hints on the meaning of error codes can be found in the driver documentation and the protocol/PLC description.

5. At the end of your test set back the diagnosis level from **Debug** or **Deep Debug**. At **Debug** and **Deep Debug** there are a great deal of data for logging which are saved to the hard drive and which can influence your system performance. They are still logged even after you close the Diagnosis Viewer.

You can find further information on the Diagnosis Viewer in the Diagnose Viewer (main.chm::/12464.htm) manual.

### 10.2 Error numbers

**ERROR CODES IN THE API**

The following is a list of possible error codes returned by the WSAGetLastError call, along with their extended explanations. Errors are listed in alphabetical order by error macro. Some error codes defined in Winsock2.h are not returned from any function-these are not included in this topic.
<table>
<thead>
<tr>
<th>Error (Code)</th>
<th>Meaning</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>WSAEACCES (10013)</td>
<td>Permission denied.</td>
<td>An attempt was made to access a socket in a way forbidden by its access permissions. An example is using a broadcast address for sendto without broadcast permission being set using setsockopt(SO_BROADCAST). Another possible reason for the WSAEACCES error is that when the bind function is called (on Windows NT 4 SP4 or later), another application, service, or kernel mode driver is bound to the same address with exclusive access. Such exclusive access is a new feature of Windows NT 4 SP4 and later, and is implemented by using the SO_EXCLUSIVEADDRUSE option.</td>
</tr>
<tr>
<td>WSAFEADDRINUSE (10048)</td>
<td>Address already in use.</td>
<td>Typically, only one usage of each socket address (protocol/IP address/port) is permitted. This error occurs if an application attempts to bind to an IP address/port that has already been used for an existing socket, or a socket that was not closed properly, or one that is still in the process of closing. For server applications that need to bind multiple sockets to the same port number, consider using setsockopt(SO_REUSEADDR). Client applications usually need not call bind at all—connect chooses an unused port automatically. When bind is called with a wildcard address (involving ADDR_ANY), a WSAFEADDRINUSE error could be delayed until the specific address is committed. This could happen with a call to another function later, including connect, listen, WSAConnect, or WSAJoinLeaf.</td>
</tr>
<tr>
<td>WSAFEADDRNOTAVAILABLE (10049)</td>
<td>Cannot assign requested address.</td>
<td>The requested address is not valid in its context. This normally results from an attempt to bind to an address that is not valid for the local machine. This can also result from connect, sendto, WSAConnect, WSAJoinLeaf, or WSAConnection when the remote address or port is not valid for a remote machine (for example, address or port 0).</td>
</tr>
<tr>
<td>WSAFEAFNOSUPPORT (10047)</td>
<td>Address family not supported by protocol family.</td>
<td>An address incompatible with the requested protocol was used. All sockets are created with an associated address family (that is, AF_INET for Internet Protocols) and a generic protocol type (that is, SOCK_STREAM). This error is returned if an incorrect protocol is explicitly requested in the socket call, or if an address of the wrong family is used for a socket, for example, in sendto.</td>
</tr>
<tr>
<td>WSAFEALREADY (10037)</td>
<td>Operation already in progress.</td>
<td>An operation was attempted on a nonblocking socket with an operation already in progress—that is, calling connect a second time on a nonblocking socket that is already connecting, or canceling an asynchronous request (WSAAsyncGetXbyY) that has already been canceled or completed.</td>
</tr>
<tr>
<td>WSAFECONNABORTED</td>
<td>Software caused</td>
<td>An established connection was aborted by the software in your</td>
</tr>
<tr>
<td>Error Code</td>
<td>Description</td>
<td></td>
</tr>
<tr>
<td>------------</td>
<td>-------------</td>
<td></td>
</tr>
<tr>
<td>D (10053)</td>
<td>Connection abort. Host machine, possibly due to a data transmission time-out or protocol error.</td>
<td></td>
</tr>
<tr>
<td>WSAECONNREFUSED (10061)</td>
<td>Connection refused. No connection could be made because the target machine actively refused it. This usually results from trying to connect to a service that is inactive on the foreign host—that is, one with no server application running.</td>
<td></td>
</tr>
<tr>
<td>WSAECONNRESET (10054)</td>
<td>Connection reset by peer. An existing connection was forcibly closed by the remote host. This normally results if the peer application on the remote host is suddenly stopped, the host is rebooted, or the remote host uses a hard close (see setsockopt for more information on the SO_LINGER option on the remote socket.) This error may also result if a connection was broken due to keep-alive activity detecting a failure while one or more operations are in progress. Operations that were in progress fail with WSAENETRESET. Subsequent operations fail with WSAECONNRESET.</td>
<td></td>
</tr>
<tr>
<td>WSAEDESTADDRREQ (10039)</td>
<td>Destination address required. A required address was omitted from an operation on a socket. For example, this error is returned if sendto is called with the remote address of ADDR_ANY.</td>
<td></td>
</tr>
<tr>
<td>WSAEFAULT (10014)</td>
<td>Bad address. The system detected an invalid pointer address in attempting to use a pointer argument of a call. This error occurs if an application passes an invalid pointer value, or if the length of the buffer is too small. For instance, if the length of an argument, which is a SOCKADDR structure, is smaller than the sizeof(SOCKADDR).</td>
<td></td>
</tr>
<tr>
<td>WSAEHOSTDOWN (10064)</td>
<td>Host is down. A socket operation failed because the destination host is down. A socket operation encountered a dead host. Networking activity on the local host has not been initiated. These conditions are more likely to be indicated by the error WSAETIMEDOUT.</td>
<td></td>
</tr>
<tr>
<td>WSAEHOSTUNREACH (10065)</td>
<td>No route to host. A socket operation was attempted to an unreachable host. See WSAENETUNREACH.</td>
<td></td>
</tr>
<tr>
<td>WSAEINPROGRESS (10036)</td>
<td>Operation now in progress. A blocking operation is currently executing. Windows Sockets only allows a single blocking operation-per-task or thread-to be outstanding, and if any other function call is made (whether or not it references that or any other socket) the function fails with the WSAEINPROGRESS error.</td>
<td></td>
</tr>
<tr>
<td>WSAEINTR (10004)</td>
<td>Interrupted function call. A blocking operation was interrupted by a call to WSACancelBlockingCall.</td>
<td></td>
</tr>
</tbody>
</table>
| WSAEINVAL | Invalid argument. Some invalid argument was supplied (for example, specifying an invalid level to the setsockopt function). In some instances, it also refers to the current state of the socket—for instance,
<table>
<thead>
<tr>
<th>Error Code</th>
<th>Error Message</th>
</tr>
</thead>
<tbody>
<tr>
<td>WSAEISCONN</td>
<td>Socket is already connected. A connect request was made on an already-connected socket. Some implementations also return this error if sendto is called on a connected SOCK_DGRAM socket (for SOCK_STREAM sockets, the to parameter in sendto is ignored) although other implementations treat this as a legal occurrence.</td>
</tr>
<tr>
<td>WSAEMFILE</td>
<td>Too many open files. Too many open sockets. Each implementation may have a maximum number of socket handles available, either globally, per process, or per thread.</td>
</tr>
<tr>
<td>WSAEMSGSIZE</td>
<td>Message too long. A message sent on a datagram socket was larger than the internal message buffer or some other network limit, or the buffer used to receive a datagram was smaller than the datagram itself.</td>
</tr>
<tr>
<td>WSAENETDOWN</td>
<td>Network is down. A socket operation encountered a dead network. This could indicate a serious failure of the network system (that is, the protocol stack that the Windows Sockets DLL runs over), the network interface, or the local network itself.</td>
</tr>
<tr>
<td>WSAENETRESET</td>
<td>Network dropped connection on reset. The connection has been broken due to keep-alive activity detecting a failure while the operation was in progress. It can also be returned by setsockopt if an attempt is made to set SO_KEEPALIVE on a connection that has already failed.</td>
</tr>
<tr>
<td>WSAENETUNREACH</td>
<td>Network is unreachable. A socket operation was attempted to an unreachable network. This usually means the local software knows no route to reach the remote host.</td>
</tr>
<tr>
<td>WSAENOBUFS</td>
<td>No buffer space available. An operation on a socket could not be performed because the system lacked sufficient buffer space or because a queue was full.</td>
</tr>
<tr>
<td>WSAENOPROTOOPT</td>
<td>Bad protocol option. An unknown, invalid or unsupported option or level was specified in a getsockopt or setsockopt call.</td>
</tr>
<tr>
<td>WSAENOTCONN</td>
<td>Socket is not connected. A request to send or receive data was disallowed because the socket is not connected and (when send-ing on a datagram socket using sendto) no address was supplied. Any other type of operation might also return this error—for example, setsockopt setting SO_KEEPALIVE if the connection has been reset.</td>
</tr>
<tr>
<td>WSAENOTSOCK</td>
<td>Socket operation on nonsocket. An operation was attempted on something that is not a socket. Either the socket handle parameter did not reference a valid socket, or for select, a member of an fd_set was not valid.</td>
</tr>
<tr>
<td>WSAEOPNOTSUPP</td>
<td>Operation not supported. The attempted operation is not supported for the type of object referenced. Usually this occurs when a socket descriptor to a socket that cannot support this operation is trying to accept a connection on a datagram socket.</td>
</tr>
<tr>
<td>Error Code</td>
<td>Description</td>
</tr>
<tr>
<td>------------</td>
<td>-------------</td>
</tr>
<tr>
<td>WSAEPFNOSUPPORT (10046)</td>
<td>Protocol family not supported. The protocol family has not been configured into the system or no implementation for it exists. This message has a slightly different meaning from WSAEAFNOSUPPORT. However, it is interchangeable in most cases, and all Windows Sockets functions that return one of these messages also specify WSAEAFNOSUPPORT.</td>
</tr>
<tr>
<td>WSAEPROCLIM (10067)</td>
<td>Too many processes. A Windows Sockets implementation may have a limit on the number of applications that can use it simultaneously. WSAStartup may fail with this error if the limit has been reached.</td>
</tr>
<tr>
<td>WSAEPROTONOSUPPORT (10043)</td>
<td>Protocol not supported. The requested protocol has not been configured into the system, or no implementation for it exists. For example, a socket call requests a SOCK_DGRAM socket, but specifies a stream protocol.</td>
</tr>
<tr>
<td>WSAEPROTOTYPE (10041)</td>
<td>Protocol wrong type for socket. A protocol was specified in the socket function call that does not support the semantics of the socket type requested. For example, the ARPA Internet UDP protocol cannot be specified with a socket type of SOCK_STREAM.</td>
</tr>
<tr>
<td>WSAESHUTDOWN (10058)</td>
<td>Cannot send after socket shutdown. A request to send or receive data was disallowed because the socket had already been shut down in that direction with a previous shutdown call. By calling shutdown a partial close of a socket is requested, which is a signal that sending or receiving, or both have been discontinued.</td>
</tr>
<tr>
<td>WSAESOCKTNOSUPPORT (10044)</td>
<td>Socket type not supported. The support for the specified socket type does not exist in this address family. For example, the optional type SOCK_RAW might be selected in a socket call, and the implementation does not support SOCK_RAW sockets at all.</td>
</tr>
<tr>
<td>WSAETIMEDOUT (10060)</td>
<td>Connection timed out. A connection attempt failed because the connected party did not properly respond after a period of time, or the established connection failed because the connected host has failed to respond.</td>
</tr>
<tr>
<td>WSATYPE_NOT_FOUND (10109)</td>
<td>Class type not found. The specified class was not found.</td>
</tr>
<tr>
<td>WSAEWOULD.block (10035)</td>
<td>Resource temporarily unavailable. This error is returned from operations on nonblocking sockets that cannot be completed immediately, for example recv when no data is queued to be read from the socket. It is a nonfatal error, and the operation should</td>
</tr>
</tbody>
</table>
### Error Analysis

<table>
<thead>
<tr>
<th>Error Code</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>WSAHOST_NOT_FOUND</td>
<td>Host not found. No such host is known. The name is not an official host name or alias, or it cannot be found in the data-base(s) being queried. This error may also be returned for protocol and service queries, and means that the specified name could not be found in the relevant database.</td>
</tr>
<tr>
<td>WSA_INVALID_HANDLE</td>
<td>Specified event object handle is invalid. An application attempts to use an event object, but the specified handle is not valid.</td>
</tr>
<tr>
<td>WSA_INVALID_PARAMETER</td>
<td>One or more parameters are invalid. An application used a Windows Sockets function which directly maps to a Win32 function. The Win32 function is indicating a problem with one or more parameters.</td>
</tr>
<tr>
<td>WSAINVALIDPROCEDURE</td>
<td>Invalid procedure table from service provider. A service provider returned a bogus procedure table to Ws2_32.dll. (Usually caused by one or more of the function pointers being null.)</td>
</tr>
<tr>
<td>WSA_INVALID_PROVIDER</td>
<td>Invalid service provider version number. A service provider returned a version number other than 2.0.</td>
</tr>
<tr>
<td>WSA_IO_INCOMPLETE</td>
<td>Overlapped I/O event object not in signaled state. The application has tried to determine the status of an overlapped operation which is not yet completed. Applications that use WSAGetOverlappedResult (with the fWait flag set to FALSE) in a polling mode to determine when an overlapped operation has completed, get this error code until the operation is complete.</td>
</tr>
<tr>
<td>WSA_IO_PENDING</td>
<td>Overlapped operations will complete later. The application has initiated an overlapped operation that cannot be completed immediately. A completion indication will be given later when the operation has been completed.</td>
</tr>
<tr>
<td>WSA_NOT_ENOUGH_MEMORY</td>
<td>Insufficient memory available. An application used a Windows Sockets function that directly maps to a Win32 function. The Win32 function is indicating a lack of required memory resources.</td>
</tr>
<tr>
<td>WSANOTINITIALISE</td>
<td>Successful Either the application has not called WSASStartup or</td>

<tr>
<td>Error Code</td>
<td>Description</td>
</tr>
<tr>
<td>------------</td>
<td>-------------</td>
</tr>
<tr>
<td>D (10093)</td>
<td>WSAStartup not yet performed.</td>
</tr>
<tr>
<td>WSANO_DATA (11004)</td>
<td>Valid name, no data record of requested type.</td>
</tr>
<tr>
<td>WSANO_RECOVERY (11003)</td>
<td>This is a nonrecoverable error.</td>
</tr>
<tr>
<td>WSAPROVIDERFAIL EDINIT (OS dependent)</td>
<td>Unable to initialize a service provider.</td>
</tr>
<tr>
<td>WSAASYSCALLFAILU RE (OS dependent)</td>
<td>System call failure.</td>
</tr>
<tr>
<td>WSASYSNOTREADY (10091)</td>
<td>Network subsystem is unavailable.</td>
</tr>
</tbody>
</table>
### Error analysis

<table>
<thead>
<tr>
<th>Code</th>
<th>Message</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>WSATRY_AGAIN (11002)</td>
<td>Nonauthoritative host not found.</td>
<td>This is usually a temporary error during host name resolution and means that the local server did not receive a response from an authoritative server. A retry at some time later may be successful.</td>
</tr>
<tr>
<td>WSAVERNOTSUPPORTED (10092)</td>
<td>Winsock.dll version out of range.</td>
<td>The current Windows Sockets implementation does not support the Windows Sockets specification version requested by the application. Check that no old Windows Sockets DLL files are being accessed.</td>
</tr>
<tr>
<td>WSAEDISCON (10101)</td>
<td>Graceful shutdown in progress.</td>
<td>Returned by WSAREcv and WSAREcvFrom to indicate that the remote party has initiated a graceful shut-down sequence.</td>
</tr>
<tr>
<td>WSA_OPERATION_ABORTED (OS dependent)</td>
<td>Overlapped operation aborted.</td>
<td>An overlapped operation was canceled due to the closure of the socket, or the execution of the SIO_FLUSH command in WSAIoctl.</td>
</tr>
</tbody>
</table>

### 10.3 Check list

- Is the Simotion device for the communication connected to the power supply?
- Is the PC or the PLC connected to the network?
- Are the used datablocks defined correctly in the PLC?
- Are all participants in the same subnet?
- Is the configuration file on the target computer?
- Has the error protocol been analyzed?

For additional error analyses, please send a project backup and the “error file” to the support.
