1 Welcome to COPA-DATA help

ZENON VIDEO-TUTORIALS

You can find practical examples for project configuration with zenon in our YouTube channel (https://www.copadata.com/tutorial_menu). The tutorials are grouped according to topics and give an initial insight into working with different zenon modules. All tutorials are available in English.

GENERAL HELP

If you cannot find any information you require in this help chapter or can think of anything that you would like added, please send an email to documentation@copadata.com.

PROJECT SUPPORT

You can receive support for any real project you may have from our Support Team, who you can contact via email at support@copadata.com.

LICENSES AND MODULES

If you find that you need other modules or licenses, our staff will be happy to help you. Email sales@copadata.com.

2 Telco_32

FOR WHICH PLCs

The driver establishes the connection between zenon and a TELCO200 telecontrol central station.
CONNECTION

The driver uses the serial interface exclusively for communicating with the central station of the telecontrol system. The central station can connect with external stations to read data or forward commands.

Certain zenon variables can be used to query the status of the central station and the external stations. The different stations are equipped with several modules that perform different tasks (messages, measured values, counters, sensors, commands). The numbers of the modules are saved in the file TELCO200.INI in the subfolder custom\drivers of the Runtime directory.

### DRIVER VERSIONING

The versioning of the drivers was changed with zenon 7.10. There is a cross-version build number as of this version. This is the number in the 4th position of the file version.
For example: **7.10.0.4228** means: The driver is for version **7.10** service pack **0**, and has the build number **4228**.

Expansions or error rectifications will be incorporated into a build in the future and are then available from the next consecutive build number.

A driver extension was implemented in build **4228**. The driver that you are using is build number **8322**. Because the build number of your driver is higher than the build number of the extension, the extension is included. The version number of the driver (the first three digits of the file version) do not have any significance in relation to this. The drivers are version-agnostic.

**5 Requirements**

This chapter contains information on the requirements that are necessary for use of this driver.

**6 Configuration**

In this chapter you will learn how to use the driver in a project and which settings you can change.

Find out more about further settings for zenon variables in the chapter Variables (main.chm::/15247.htm) of the online manual.
### 6.1 Creating a driver

In the **Create driver** dialog, you create a list of the new drivers that you want to create.

![Create driver dialog](image)

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
</table>
| **Available drivers** | List of all available drivers. The display is in a tree structure:  
|                    | [+] expands the folder structure and shows the drivers contained therein. [-] reduces the folder structure  
| Default: **no selection** |                                                                                                                                              |
| **Driver name**    | Unique **Identification** of the driver.  
|                    | Default: **Empty**  
|                    | The input field is pre-filled with the pre-defined **Identification** after selecting a driver from the list of available drivers. |
CLOSE DIALOG

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>OK</td>
<td>Accepts all settings and opens the driver configuration dialog of the selected driver.</td>
</tr>
<tr>
<td>Cancel</td>
<td>Discards all changes and closes the dialog.</td>
</tr>
<tr>
<td>Help</td>
<td>Opens online help.</td>
</tr>
</tbody>
</table>

**Information**

The content of this dialog is saved in the file called Treiber_[Language].xml. You can find this file in the following folder:

C:\ProgramData\COPA-DATA\zenon[version number].

**CREATE NEW DRIVER**

In order to create a new driver:

1. Right-click on Driver in the Project Manager and select New driver in the context menu.
   Optional: Select the New driver button from the toolbar of the detail view of the Variables.
   The Create driver dialog is opened.
2. The dialog offers a list of all available drivers.

3. Select the desired driver and name it in the **Driver name** input field. This input field corresponds to the **Identification** property. The name of the selected driver is automatically inserted into this input field by default.

   The following is applicable for the **Driver name**:
   - The **Driver name** must be unique.
     - If a driver is used more than once in a project, a new name has to be given each time.
     - This is evaluated by clicking on the **OK** button. If the driver is already present in the project, this is shown with a warning dialog.
   - The **Driver name** is part of the file name.
     - Therefore it may only contain characters which are supported by the operating system.
     - Invalid characters are replaced by an underscore (_).
   - **Attention**: This name cannot be changed later on.

4. Confirm the dialog by clicking on the **OK** button.
   The configuration dialog for the selected driver is opened.

**Note**: The language of driver names cannot be switched. They are always shown in the language in which they have been created, regardless of the language of the Editor. This also applies to driver object types.
**DRIVER NAME DIALOG ALREADY EXISTS**

If there is already a driver in the project, this is shown in a dialog. The warning dialog is closed by clicking on the **OK** button. The driver can be named correctly.

![Dialog showing driver name already exists]

**ZENON PROJECT**

The following drivers are created automatically for newly-created projects:

- Intern
- MathDr32
- SysDrv

💡 **Information**

Only the required drivers need to be present in a zenon project. Drivers can be added at a later time if required.

---

**6.2 Settings in the driver dialog**

You can change the following settings of the driver:
### 6.2.1 General

The configuration dialog is opened when a driver is created. In order to be able to open the dialog later for editing, double click on the driver in the list or click on the Configuration property.

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Mode</td>
<td>Allows to switch between hardware mode and simulation mode</td>
</tr>
<tr>
<td></td>
<td>• <strong>Hardware</strong>: A connection to the control is established.</td>
</tr>
<tr>
<td></td>
<td>• <strong>Simulation - static</strong>: No communication between to the control is established, the values are simulated by the driver. In this modus the values remain constant or the variables keep the values which were set by zenon Logic. Each variable has its own memory area. E.g. two variables of the type marker with offset 79 can have different values in the Runtime and do not influence each other. Exception: The simulator driver.</td>
</tr>
<tr>
<td></td>
<td>• <strong>Simulation - counting</strong>: No communication between to the control is established, the values are simulated by the driver. In this modus the driver increments the values</td>

</tr>
<tr>
<td><strong>Global Update time</strong></td>
<td>Setting for the global update times in milliseconds:</td>
</tr>
<tr>
<td></td>
<td>‣ <strong>Active:</strong></td>
</tr>
<tr>
<td></td>
<td>The set <strong>Global update time</strong> is used for all variables in the project. The priority set at the variables is not used.</td>
</tr>
<tr>
<td></td>
<td>‣ <strong>Inactive:</strong></td>
</tr>
<tr>
<td></td>
<td>The set priorities are used for the individual variables.</td>
</tr>
</tbody>
</table>
**Option** | **Description**
---|---
**Exceptions:** Spontaneous drivers ignore this option. They generally use the shortest possible update time. For details, see the **Spontaneous driver update time** section.

**Priority**
The polling times for the individual priority classes are set here. All variables with the according priority are polled in the set time.

The variables are allocated separately in the settings of the variable properties.
The communication of the individual variables can be graded according to importance or required topicality using the priority classes. Thus the communication load is distributed better.

**Attention:** Priority classes are not supported by each driver, e.g. spontaneously communicating zenon drivers.

### CLOSE DIALOG

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>

</tr>
<tr>
<td>Help</td>
<td>Opens online help.</td>
</tr>
</tbody>
</table>

### UPDATE TIME FOR SPONTANEOUS DRIVERS

With spontaneous drivers, for **Set value, advising** of variables and **Requests**, a read cycle is triggered immediately - regardless of the set update time. This ensures that the value is immediately available for visualization after writing. The update time is generally 100 ms.

Spontaneous drivers are ArchDrv, BiffiDCM, BrTcp32, DNP3, Esser32, FipDrv32, FpcDrv32, IEC850, IEC870, IEC870_103, Otis, RTK9000, S7DCOS, SAIA_Slave, STRATON32 and Trend32.

The settings are saved in the project database (for earlier versions in zenon.ini)

7 Creating variables

This is how you can create variables in the zenon Editor:

7.1 Creating variables in the Editor

Variables can be created:

- as simple variables
- in arrays (main.chm::/15262.htm)
- as structure variables (main.chm::/15278.htm)

VARIABLE DIALOG

To create a new variable, regardless of which type:
Creating variables

1. Select the **New variable** command in the **Variables** node in the context menu

   The dialog for configuring variables is opened

2. Configure the variable

3. The settings that are possible depends on the type of variables
Creating variables

CREATE VARIABLE DIALOG

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Distinct name of the variable. If a variable with the same name already exists in the project, no additional variable can be created with this name. Maximum length: 128 characters</td>
</tr>
<tr>
<td></td>
<td><strong>Attention:</strong> the characters # and @ are not permitted in variable names. If non-permitted characters are used, creation of variables cannot be completed and the <strong>Finish</strong> button remains inactive. <strong>Note:</strong> For some drivers, the addressing is possible over the property <strong>Symbolic address</strong>, as well.</td>
</tr>
<tr>
<td>Drivers</td>
<td>Select the desired driver from the drop-down list. <strong>Note:</strong> If no driver has been opened in the project, the driver for internal variables (Intern.exe (Main.chm::/Intern.chm::/Intern.htm)) is automatically loaded.</td>
</tr>
<tr>
<td>Driver Object Type</td>
<td>Select the appropriate driver object type from the drop-down list.</td>
</tr>
<tr>
<td>(cti.chm::/28685.htm)</td>
<td></td>
</tr>
<tr>
<td>Data Type</td>
<td>Select the desired data type. Click on the ... button to open the</td>
</tr>
</tbody>
</table>
Creating variables

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Array settings</td>
<td>Expanded settings for array variables. You can find details in the Arrays chapter.</td>
</tr>
<tr>
<td>Addressing options</td>
<td>Expanded settings for arrays and structure variables. You can find details in the respective section.</td>
</tr>
<tr>
<td>Automatic addressing</td>
<td>Expanded settings for arrays and structure variables. You can find details in the respective section.</td>
</tr>
</tbody>
</table>

**SYMBOLIC ADDRESS**

The **Symbolic address** property can be used for addressing as an alternative to the **Name** or **Identification** of the variables. Selection is made in the driver dialog; configuration is carried out in the variable property. When importing variables of supported drivers, the property is entered automatically.

Maximum length: 1024 characters.

The following drivers support the **Symbolic address**:

- 3S_V3
- AzureDrv
- BACnetNG
- IEC850
- KabaDPServer
- OPCUA32
- Phoenix32
- POZYTON
- RemoteRT
- S7TIA
- SEL
- SnmpNg32
- PA_Drv

**INHERITANCE FROM DATA TYPE**

**Measuring range**, **Signal range** and **Set value** are always:

- derived from the datatype
- Automatically adapted if the data type is changed
Note for signal range: If a change is made to a data type that does not support the set signal range, the signal range is amended automatically. For example, for a change from INT to SINT, the signal range is changed to 127. The amendment is also carried out if the signal range was not inherited from the data type. In this case, the measuring range must be adapted manually.

7.2 Addressing

<table>
<thead>
<tr>
<th>Group/Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>General</td>
<td>Property group for general settings.</td>
</tr>
<tr>
<td>Name</td>
<td>Freely definable name.</td>
</tr>
<tr>
<td></td>
<td><strong>Attention:</strong> For every zenon project the name must be unambiguous.</td>
</tr>
<tr>
<td>Identification</td>
<td>Freely definable identification. E.g. for Resources label, comments, ...</td>
</tr>
<tr>
<td>Addressing</td>
<td></td>
</tr>
<tr>
<td>Net address</td>
<td>Bus address or net address of the variable.</td>
</tr>
<tr>
<td></td>
<td>This address refers to the bus address in the connection configuration of the driver. This defines the PLC, on which the variable resides.</td>
</tr>
<tr>
<td>Data block</td>
<td>For variables of object type <em>Extended data block</em>, enter the datablock number here.</td>
</tr>
<tr>
<td></td>
<td>Adjustable from 0 to 4294967295.</td>
</tr>
<tr>
<td></td>
<td>You can take the exact maximum area for data blocks from the manual of the PLC.</td>
</tr>
<tr>
<td>Offset</td>
<td>Offset of variables. Equal to the memory address of the variable in the PLC. Adjustable from 0 to 4294967295.</td>
</tr>
<tr>
<td>Alignment</td>
<td>not used for this driver</td>
</tr>
<tr>
<td>Bit number</td>
<td>Number of the bit within the configured offset.</td>
</tr>
<tr>
<td></td>
<td>Possible entries: 0 to 65535.</td>
</tr>
<tr>
<td>String length</td>
<td>Only available for String variables. Maximum number of characters that the variable can take.</td>
</tr>
<tr>
<td>Driver connection/Data Type</td>
<td>Data type of the variable. Is selected during the creation of the variable; the type can be changed here.</td>
</tr>
</tbody>
</table>
Creating variables

<table>
<thead>
<tr>
<th>Group/Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Attention:</strong> If you change the data type later, all other properties of the variable must be checked and adjusted, if necessary.</td>
<td></td>
</tr>
<tr>
<td><strong>Driver connection/Driver Object Type</strong></td>
<td>Object type of the variables. Depending on the driver used, is selected when the variable is created and can be changed here.</td>
</tr>
<tr>
<td><strong>Driver connection/Priority</strong></td>
<td>Setting the priority class. The variable of the priority class is thus assigned as it was configured in the driver dialog in the <strong>General</strong> tab. The priority classes are only used if the <strong>global update time</strong> is deactivated. If the <strong>global update time</strong> option is activated and the priority classes are used, there is an error entry in the log file of the system. The driver uses the highest possible priority.</td>
</tr>
</tbody>
</table>

Compared to earlier versions, the names of the address elements have changed. Instead of the terms "Station", "Module" and "Channel" previously used, the standard terms "Net address", "Data block" and "Offset" are used in the current version.

<table>
<thead>
<tr>
<th>Old term</th>
<th>New term</th>
</tr>
</thead>
<tbody>
<tr>
<td>Station</td>
<td>Net address</td>
</tr>
<tr>
<td>Module</td>
<td>Data block</td>
</tr>
<tr>
<td>Channel</td>
<td>Offset</td>
</tr>
</tbody>
</table>

**CONFIGURATION FILE**

The file `telco200.ini` in the subdirectory `custom\drivers` of the project directory contains the definition of the module numbers of the stations (in earlier versions `zenon.ini`).

The file has the following structure: (x is a consecutive index that allows you to define several discontiguous number ranges for every module type)

```
[TELCO200]  

Sector ID, always TELCO200

MOD_MELDUNG_VON_x=  The valid module numbers for the messages
```
Creating variables

MOD_MELDUNG_BIS_x = \( x = 1, 2, 3, \ldots \) (numbered consecutively, starting with 1)

\((\text{MOD}_\text{MELDUNG}_\text{VON}_x \leq \text{MOD}_\text{MELDUNG}_\text{BIS}_x)\)

MOD_MESSWERT8_VON_x = The valid module numbers for the 8-bit measured values

MOD_MESSWERT8_BIS_x = \( x = 1, 2, 3, \ldots \) (numbered in pairs, starting with 1)

\((\text{MOD}_\text{MESSWERT8}_\text{VON}_x \leq \text{MOD}_\text{MESSWERT8}_\text{BIS}_x)\)

MOD_MESSWERT12_VON_x = The valid module numbers for the 12 bit measured values

MOD_MESSWERT12_BIS_x = \( x = 1, 2, 3, \ldots \) (numbered in pairs, starting with 1)

\((\text{MOD}_\text{MESSWERT12}_\text{VON}_x \leq \text{MOD}_\text{MESSWERT12}_\text{BIS}_x)\)

MOD_ZAEHLWERT_VON_x = The valid module numbers for the counted values

MOD_ZAEHLWERT_BIS_x = \( x = 1, 2, 3, \ldots \) (numbered in pairs, starting with 1)

\((\text{MOD}_\text{ZAEHLWERT}_\text{VON}_x \leq \text{MOD}_\text{ZAEHLWERT}_\text{BIS}_x)\)

MOD_BEFEHL_VON_x = The valid module numbers for the commands

MOD_BEFEHL_BIS_x = \( x = 1, 2, 3, \ldots \) (numbered in pairs, starting with 1)

\((\text{MOD}_\text{BEFEHL}_\text{VON}_x \leq \text{MOD}_\text{BEFEHL}_\text{BIS}_x)\)

MOD_MESSGEBER_VON_x = The valid module numbers for the sensors

MOD_MESSGEBER_BIS_x = \( x = 1, 2, 3, \ldots \) (numbered in pairs, starting with 1)

\((\text{MOD}_\text{BEFEHL}_\text{VON}_x \leq \text{MOD}_\text{BEFEHL}_\text{BIS}_x)\)

STAPELZEIGEN=0

If set to 1, the command “Display number of commands in the stack.” (value=100) is activated via the status channel of the central station. (Default value is 0).
### 7.3 Driver objects and datatypes

Driver objects are areas available in the PLC, such as markers, data blocks etc. Here you can find out which driver objects are provided by the driver and which IEC data types can be assigned to the respective driver objects.

#### 7.3.1 Driver objects

The following object types are available in this driver:

<table>
<thead>
<tr>
<th>Driver object types</th>
<th>Channel type</th>
<th>Supported datatypes (DataType)</th>
<th>Read</th>
<th>Write</th>
<th>Comment</th>
</tr>
</thead>
<tbody>
<tr>
<td>Central station status</td>
<td>80</td>
<td>UINT</td>
<td>X</td>
<td>X</td>
<td>Status of the central station</td>
</tr>
<tr>
<td>External station status</td>
<td>81</td>
<td>UINT</td>
<td>X</td>
<td>X</td>
<td>Status of the AS (external station)</td>
</tr>
<tr>
<td></td>
<td></td>
<td>STRING</td>

- **- -**: not supported
7.3.2 Mapping of the data types

All variables in zenon are derived from IEC data types. The following table compares the IEC datatypes with the datatypes of the PLC.

**CENTRAL STATION STATUS**

For every driver, you can only create one variable of this type. The values have the following meaning:

<table>
<thead>
<tr>
<th>Direction</th>
<th>Value</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>Read</td>
<td>0</td>
<td>&quot;Computer system TELCO 4000 and data recording system in operation&quot;</td>
</tr>
<tr>
<td></td>
<td>1</td>
<td>&quot;System error computer system TELCO 4000&quot;</td>
</tr>
<tr>
<td></td>
<td>2</td>
<td>&quot;Dialing to external station&quot;</td>
</tr>
<tr>
<td></td>
<td>4</td>
<td>&quot;Dialing to external station failed&quot;</td>
</tr>
<tr>
<td></td>
<td>8</td>
<td>&quot;Connection to external station active&quot;</td>
</tr>
<tr>
<td></td>
<td>16</td>
<td>&quot;Terminating connection to external station&quot;</td>
</tr>
<tr>
<td></td>
<td>32</td>
<td>&quot;Transmitting command or set value to external station&quot;</td>
</tr>
<tr>
<td></td>
<td>64</td>
<td>&quot;Updating measurands&quot;</td>
</tr>
<tr>
<td></td>
<td>128</td>
<td>&quot;Measurands update canceled&quot;</td>
</tr>
<tr>
<td></td>
<td>256</td>
<td>&quot;Error in zenon command&quot; (e.g. &quot;E&quot; command without establishing a connection first; &quot;A&quot; command when there is already a connection to another station; ...)</td>
</tr>
<tr>
<td></td>
<td>512</td>
<td>Stack overflow</td>
</tr>
<tr>
<td>Write</td>
<td>1</td>
<td>Command &quot;T&quot; - Terminate connection</td>
</tr>
<tr>
<td></td>
<td>2</td>
<td>Command &quot;E&quot; - Maintain connection</td>
</tr>
<tr>
<td></td>
<td>3</td>
<td>Delete all status channels (set to 0).</td>
</tr>
<tr>
<td></td>
<td>4</td>
<td>Delete stack (all commands will be removed from the stack)</td>
</tr>
<tr>
<td></td>
<td>100</td>
<td>Display number of commands in stack in a dialog box. (also see &quot;STAPELZEIGEN=...&quot; in TELCO200.INI)</td>
</tr>
</tbody>
</table>
EXTERNAL STATION STATUS

For every external station, you can only create two variables of this type: one UINT variable and one STRING variable each. The variable with the data type STRING stores the time of the last connection with the external station.

The variable with the data type UINT is used to transmit status information about the external station:

<table>
<thead>
<tr>
<th>Direction</th>
<th>Value</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>Read</td>
<td>0</td>
<td>&quot;Computer system TELCO 4000 and data recording system in operation&quot;</td>
</tr>
<tr>
<td></td>
<td>2</td>
<td>&quot;Dialling to external station&quot;</td>
</tr>
<tr>
<td></td>
<td>4</td>
<td>&quot;Dialing to external station failed&quot;</td>
</tr>
<tr>
<td></td>
<td>8</td>
<td>&quot;Connection to external station active&quot;</td>
</tr>
<tr>
<td></td>
<td>16</td>
<td>&quot;Terminating connection to external station&quot;</td>
</tr>
<tr>
<td></td>
<td>32</td>
<td>&quot;Transmitting command or set value to external station&quot;</td>
</tr>
<tr>
<td></td>
<td>64</td>
<td>&quot;Updating measurands&quot;</td>
</tr>
<tr>
<td></td>
<td>128</td>
<td>&quot;Measurands update canceled&quot;</td>
</tr>
</tbody>
</table>
|           | 256   | "Error in zenon command" (e.g. "E" command without establishing a connection first; "A" command when there is already a connection to another station; ...)
|           | 512   | Stack overflow |
| Write     | 1     | Command "A" - Establish a connection to the external station and fetch data |
|           | 3     | Delete the status channel of the station (set to 0). |

SENSOR

After an M command, the driver reads data from a sensor. This data is then sent, like all other data, to the zenon RT module via the client-server interface. The data is then processed by the Historian in the RT and sorted into the archives. The sensor variables must therefore be marked as "post-sorted" in the hard-disk data storage properties group.

The M command is triggered by writing the value 1 to the according sensor.

Writing the configured maximum value of the variable will display a dialog with the current status of the sensor.
DATA TYPE

The term data type is the internal numerical identification of the data type. It is also used for the extended DBF import/export of the variables.

7.4 Creating variables by importing

Variables can also be imported by importing them. The XML and DBF import is available for every driver.

Information

You can find details on the import and export of variables in the Import-Export (main.chm::/13028.htm) manual in the Variables (main.chm::/13045.htm) section.

7.4.1 XML import

During XML import of variables or data types, these are first assigned to a driver and then analyzed. Before import, the user decides whether and how the respective element (variable or data type) is to be imported:

- **Import:**
  The element is imported as a new element.

- **Overwrite:**
  The element is imported and overwrites a pre-existing element.

- **Do not import:**
  The element is not imported.

Note: The actions and their durations are shown in a progress bar during import. The import of variables is described in the following documentation. Data types are imported along the same lines.

REQUIREMENTS

The following conditions are applicable during import:

- **Backward compatibility**
  At the XML import/export there is no backward compatibility. Data from older zenon versions can be taken over. The handover of data from newer to older versions is not supported.

- **Consistency**
Creating variables

The XML file to be imported has to be consistent. There is no plausibility check on importing the file. If there are errors in the import file, this can lead to undesirable effects in the project. Particular attention must be paid to this, primarily if not all properties exist in the XML file and these are then filled with default values. E.g.: A binary variable has a limit value of 300.

- **Structure data types**

Structure data types must have the same number of structure elements. Example: A structure data type in the project has 3 structure elements. A data type with the same name in the XML file has 4 structure elements. Then none of the variables based on this data type in the file are imported into the project.

---

**Hint**

You can find further information on XML import in the Import - Export manual, in the XML import (main.chm::/13046.htm) chapter.

---

### 7.4.2 DBF Import/Export

Data can be exported to and imported from dBase.

- **Information**

  Import and Export via CSV or dBase supported; no driver specific variable settings, such as formulas. Use export/import via XML for this.

**IMPORT DBF FILE**

To start the import:

1. right-click on the variable list
2. in the drop-down list of Extended export/import... select the Import dBase command
3. follow the import assistant

The format of the file is described in the chapter File structure.
Creating variables

Information

Note:
- Driver object type and data type must be amended to the target driver in the DBF file in order for variables to be imported.
- dBase does not support structures or arrays (complex variables) at import.

EXPORT DBF FILE

To start the export:
1. right-click on the variable list
2. in the drop-down list of Extended export/import... select the Export dBase... command
3. follow the export assistant

Attention

DBF files:
- must correspond to the 8.3 DOS format for filenames (8 alphanumeric characters for name, 3 character suffix, no spaces)
- must not have dots (.) in the path name.
  e.g. the path C:\users\John.Smith\test.dbf is invalid.
  Valid: C:\users\JohnSmith\test.dbf
- must be stored close to the root directory in order to fulfill the limit for file name length including path: maximum 255 characters

The format of the file is described in the chapter File structure.

Information

dBase does not support structures or arrays (complex variables) at export.

FILE STRUCTURE OF THE DBASE EXPORT FILE

The dBaseIV file must have the following structure and contents for variable import and export:
**Attention**

dBase does not support structures or arrays (complex variables) at export.

DBF files must:
- conform with their name to the 8.3 DOS format (8 alphanumeric characters for name, 3 characters for extension, no space)
- Be stored close to the root directory (Root)

**STRUCTURE**

Expressions in the column "Comment" refer to the expressions used in the dialog boxes for the definition of variables. For more information, see chapter Variable definition.

7.5 Communication details (Driver variables)

The driver kit implements a number of driver variables. This variables are part of the driver object type Communication details. These are divided into:

- Information
- Configuration
- Statistics and
- Error message

The definitions of the variables implemented in the driver kit are available in the import file DRVVAR.DBF and can be imported from there.

Path to file: %ProgramData%\COPA-DATA\zenon<Versionsnummer>\PredefinedVariables

Note: Variable names must be unique in zenon. If driver variables of the driver object type Communication details are to be imported from DRVVAR.DBF again, the variables that were imported beforehand must be renamed.

Information

Not every driver supports all driver variables of the driver object type Communication details.

For example:

- Variables for modem information are only supported by modem-compatible drivers.
- Driver variables for the polling cycle are only available for pure polling drivers.
- Connection-related information such as ErrorMSG is only supported for drivers that only edit one connection at a time.

8 Driver-specific functions

The driver supports the following functions:

**DRIVER SUPPORTS**

**ERROR FILE**
Yes

**EXTENDED ERROR FILE**
No

**SERIAL LOGGING**
Yes. See general driver documentation

**BLOCKWRITE**
No

**REDUNDANCY**
Can the driver be operated in redundant mode?

**RDA**
Yes, but only for variables of the type "Sensor"

**REAL TIME STAMPING**
Yes

**NUMBER OF PLCS**
One central station with any number of external stations

**WINCE**
No
9 Driver command function

The zenon **Driver commands** function is to influence drivers using zenon. You can do the following with a driver command:

- Start
- Stop
- Shift a certain driver mode
- Instigate certain actions

**Note:** This chapter describes standard functions that are valid for most zenon drivers. Not all functions described here are available for every driver. For example, a driver that does not, according to the data sheet, support a modem connection also does not have any modem functions.

**Attention**

The zenon **Driver commands** function is not identical to driver commands that can be executed in the Runtime with Energy drivers!

**CONFIGURATION OF THE FUNCTION**

Configuration is carried out using the **Driver commands** function. To configure the function:

1. Create a new function in the zenon Editor.
2. Navigate to the node **Variable**.

3. Select the **Driver commands** entry.

   The dialog for configuration is opened

4. Select the desired driver and the required command.

5. Close the dialog by clicking on **OK** and ensure that the function is executed in the Runtime. 

   Heed the notices in the **Driver command function in the network** section.
## DRIVER COMMAND DIALOG

![Image of Driver Command Dialog]

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Driver</td>
<td>Selection of the driver from the drop-down list. It contains all drivers loaded in the project.</td>
</tr>
<tr>
<td>Current condition</td>
<td>Fixed entry that is set by the system. Has no function in the current version.</td>
</tr>
<tr>
<td>Driver command</td>
<td>Selection of the desired driver command from a drop-down list. For details on the configurable driver commands, see the available driver commands section.</td>
</tr>
<tr>
<td>Driver-specific command</td>
<td>Entry of a command specific to the selected driver.</td>
</tr>
<tr>
<td>Note: Only available if, for the driver command option, the driver-specific command has been selected.</td>
<td></td>
</tr>
</tbody>
</table>
| Show this dialog in the Runtime | Configuration of whether the configuration can be changed in the Runtime:  
  - **Active**: This dialog is opened in the Runtime before executing the function. The configuration can thus still be changed in the Runtime before execution.  
  - **Inactive**: The Editor configuration is applied in the Runtime when executing the function. |
| Default: inactive          |                                                                                                                                                                                                         |
### CLOSE DIALOG

<table>
<thead>
<tr>
<th>Options</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>

<tr>
<td>Cancel</td>
<td>Discards all changes and closes the dialog.</td>
</tr>
<tr>
<td>Help</td>
<td>Opens online help.</td>
</tr>
</tbody>
</table>

### AVAILABLE DRIVER COMMANDS

These driver commands are available - depending on the selected driver:

<table>
<thead>
<tr>
<th>Driver command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>&lt;No command&gt;</td>
<td>No command is sent. A command that already exists can thus be removed from a configured function.</td>
</tr>
<tr>
<td>Start driver (online mode)</td>
<td>Driver is reinitialized and started. <strong>Note:</strong> If the driver has already been started, it must be stopped. Only then can the driver be re-initialized and started.</td>
</tr>
<tr>
<td>Stop driver (offline mode)</td>
<td>Driver is stopped. No new data is accepted. <strong>Note:</strong> If the driver is in offline mode, all variables that were created for this driver receive the status switched off (OFF; Bit 20).</td>
</tr>
<tr>
<td>Driver in simulation mode</td>
<td>Driver is set into simulation mode. The values of all variables of the driver are simulated by the driver. No values from the connected hardware (e.g. PLC, bus system, ...) are displayed.</td>
</tr>
<tr>
<td>Driver in hardware mode</td>
<td>Driver is set into hardware mode. For the variables of the driver the values from the connected hardware (e.g. PLC, bus system, ...) are displayed.</td>
</tr>
<tr>
<td>Driver-specific command</td>
<td>Entry of a driver-specific command. Opens input field in order to enter a command.</td>
</tr>
<tr>
<td>Activate driver write set value</td>
<td>Write set value to a driver is possible.</td>
</tr>
<tr>
<td>Deactivate driver write set value</td>
<td>Write set value to a driver is prohibited.</td>
</tr>
<tr>
<td>Establish connection with modem</td>
<td>Establish connection (for modem drivers)</td>
</tr>
</tbody>
</table>
Error analysis

<table>
<thead>
<tr>
<th>Driver command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Disconnect from modem</strong></td>
<td>Terminate connection (for modem drivers)</td>
</tr>
<tr>
<td><strong>Driver in counting simulation mode</strong></td>
<td>Driver is set into counting simulation mode. All values are initialized with 0 and incremented each time up to the maximum value and then start at 0 again.</td>
</tr>
<tr>
<td><strong>Driver in static simulation mode</strong></td>
<td>No communication to the controller is established. All values are initialized with 0.</td>
</tr>
<tr>
<td><strong>Driver in programmed simulation mode</strong></td>
<td>The values are calculated by a freely-programmable simulation project. The simulation project is created with the help of the zenon Logic Workbench and runs in the zenon Logic Runtime.</td>
</tr>
</tbody>
</table>

**DRIVER COMMAND FUNCTION IN THE NETWORK**

If the computer on which the **Driver commands** function is executed is part of the zenon network, further actions are also carried out:

- A special network command is sent from the computer to the project server. It then executes the desired action on its driver.
- In addition, the Server sends the same driver command to the project standby. The standby also carries out the action on its driver.

This makes sure that Server and Standby are synchronized. This only works if the Server and the Standby both have a working and independent connection to the hardware.

**10 Error analysis**

Should there be communication problems, this chapter will assist you in finding out the error.

**10.1 Analysis tool**

All zenon modules such as Editor, Runtime, drivers, etc. write messages to a joint log file. To display them correctly and clearly, use the Diagnosis Viewer (main.chm::/12464.htm) program that was also installed with zenon. You can find it under **Start/All programs/zenon/Tools 8.10 -> Diagviewer**.
zenon driver log all errors in the LOG files. LOG files are text files with a special structure. The default folder for the LOG files is subfolder LOG in the folder ProgramData. For example:

%ProgramData%\COPA-DATA\LOG

**Attention:** With the default settings, a driver only logs error information. With the Diagnosis Viewer you can enhance the diagnosis level for most of the drivers to "Debug" and "Deep Debug". With this the driver also logs all other important tasks and events.

In the Diagnosis Viewer you can also:

- Follow newly-created entries in real time
- customize the logging settings
- change the folder in which the LOG files are saved

**Note:**

1. The Diagnosis Viewer displays all entries in UTC (coordinated world time) and not in local time.
2. The Diagnosis Viewer does not display all columns of a LOG file per default. To display more columns activate property Add all columns with entry in the context menu of the column header.
3. If you only use Error-Logging, the problem description is in the column Error text. For other diagnosis level the description is in the column General text.
4. For communication problems many drivers also log error numbers which the PLC assigns to them. They are displayed in Error text or Error code or Driver error parameter (1 and 2). Hints on the meaning of error codes can be found in the driver documentation and the protocol/PLC description.
5. At the end of your test set back the diagnosis level from Debug or Deep Debug. At Debug and Deep Debug there are a great deal of data for logging which are saved to the hard drive and which can influence your system performance. They are still logged even after you close the Diagnosis Viewer.

**Attention**

In Windows CE errors are not logged per default due to performance reasons.

You can find further information on the Diagnosis Viewer in the Diagnose Viewer (main.chm::/12464.htm) manual.
